

SUPPLEMENTAL MATERIAL

Laboratory methods for the quantification of the biomarkers other than F2-isoP

The second oxidative stress biomarker, 8-OHdG, was quantified on 20 mL urine samples collected on admission from each patient. If the patient had an in-dwelling catheter, the reservoir was emptied 30 min before the scheduled collection and then a 20 mL sample was collected. Urine was frozen within 1 hour at -80°C until the processing. The quantification of 8-OHdG was also adjusted for urinary creatinine (8-OHdG_cr). The ORAC assay was quantified according to methods previously described.¹⁵ Total ORAC (ORAC_{TOT}) represents the antioxidant capacity of plasma; precipitation of plasma proteins by 0.5 M perchloric acid (ORAC_{PCA}) in a 1:1 ratio with the sample reflects the antioxidant capacity of the remaining small molecular weight compounds. Blood samples for ORAC assay were kept on ice until centrifugation and wrapped in foil to protect them from light. Samples were centrifuged at 13,000 rpm using a microplate centrifuge for 15 min and frozen at -80°C prior to processing.

Blood samples for MMPs were collected into 10 cc EDTA tubes, placed on water ice and immediately centrifuged at 1500 rpm for 15 min within 1 h of the blood draw; plasma was then isolated and frozen at -80 °C for later measurement. Levels of MMPs were analyzed using a commercially available enzyme-linked immunosorbent assay (ELISA) (Human MMP-9 Quantikine ELISA Kit, R&D systems, #DMP900). ELISA was performed according to the manufacturer's instructions. Blood collected in 5 mL red-top tubes drawn at baseline and 48 hours were used for sampling hs-CRP. Plasma was separated by centrifugation at 3000 rpm for 15 min and stored at -80°C until measurement. The analysis of hs-CRP was performed with a latex-enhanced turbidimetric immunoassay using polyclonal rabbit antibody.

Supplemental Table I. Multivariable binary logistic regression analysis for infarct growth (IG) including the time interval stroke onset-to-blood draw

	OR (95% CI)	P-value
lnF2-isoP	3.31 (1.49-7.34)	0.003
Age	0.99 (0.97-1.03)	0.997
Gender	0.40 (0.16-0.98)	0.045
NIHSS	1.11 (1.01-1.23)	0.03
IV t-PA	0.42 (0.17-1.02)	0.09
Prior TIA	0.21 (0.06-0.83)	0.03
Diabetes mellitus	0.79 (0.19-3.23)	0.74
Statin	4.04 (1.40-11.69)	0.01
Vitamin supplement	0.56 (0.19-1.64)	0.29
Glucose	1.01 (0.10-1.02)	0.87
lnDWIV	1.14 (0.79-1.66)	0.48
Stroke onset-to-blood draw	0.999 (0.995-1.002)	0.41

IV=intravenous; t-PA=tissue plasminogen activator; lnDWIV=natural logarithm of diffusion weighted imaging volume; lnF2-isoP=natural logarithm of F2-isoprostanate; NIHSS=National Institutes of Health Stroke Scale; TIA=transient ischemic attack

Supplemental Table II. Multivariable linear logistic regression analysis for infarct growth volume (IGV) including the time interval stroke onset-to-blood draw

	B (95% CI)	P-value
lnF2-isoP	0.44 (0.04, 0.85)	0.03
Age	-0.0001 (-0.02, 0.019)	0.995
Gender	0.05 (-0.48, 0.58)	0.85
NIHSS	0.04 (-0.01, 0.10)	0.14
IV t-PA	-0.09 (-0.62, 0.44)	0.74
Prior TIA	0.34 (-1.16, 1.85)	0.65
Diabetes mellitus	0.34 (-0.36, 1.03)	0.34
