Missing	3 (5%)	6 (10%)	17 (13 %)	19 (14 %)
\$20,000 or less	12 (21%)	9 (15%)	21 (16 %)	29 (21 %)
\$20,001 to \$50,000	17 (29%)	19 (32%)	40 (31 %)	33 (24 %)
\$50,001 to \$100,000	18 (31%)	19 (32%)	37 (28 %)	37 (27 %)
Over \$100,000	8 (14%)	7 (12%)	15 (12 %)	17 (13 %)
Marital status				
Missing	0 (0%)	2 (3%)	0 (0 %)	0 (0 %)
Committed/Married	33 (57%)	41 (68%)	86 (66 %)	90 (67 %)
Divorced/Separated	10 (17%)	9 (15%)	20 (15 %)	30 (22 %)
Never married	5 (9%)	4 (7%)	13 (10 %)	4 (3 %)
Widowed	10 (17%)	4 (7%)	11 (8 %)	11 (8 %)
Patient insurance				
Private	30 (52%)	28 (47%)	50 (38 %)	43 (32 %)
Medicare	26 (45%)	25 (42%)	67 (52 %)	80 (59 %)
Medicaid/Medi-Cal	2 (3%)	5 (8%)	12 (9 %)	10 (7 %)
Other	0 (0%)	2 (3%)	1 (1 %)	2 (1 %)
Patient religion				
Christian	43 (74%)	40 (67%)	99 (76 %)	92 (68 %)

Other	7 (12%)	5 (8%)	14 (11 %)	9 (7 %)
Non-Religious	8 (14%)	15 (25%)	17 (13 %)	34 (25 %)
Have enrolled caregiver?				
No	17 (29%)	19 (32%)	29 (22 %)	42 (31 %)
Yes	41 (71%)	41 (68%)	101 (78 %)	93 (69 %)
Physician age			43.9 (SD=10.3)	45.3 (SD=9.8)
Physician gender				
Male			12 (63 %)	15 (79 %)
Female			7 (37 %)	4 (21 %)
>50% of patients with breast cancer				
No			16 (84 %)	15 (79 %)
Yes			3 (16 %)	4 (21 %)
Physician Race				
Asian			8 (42 %)	8 (42 %)
White			7 (37 %)	10 (53 %)
Other			4 (21 %)	1 (5 %)

* Only 7 (4 white, 3 non-white) reported as Latino in the RCT sample, and only 1 (white) reported as Latino in the Pre-RCT sample.

*** "Aggressive" cancers were determined prospectively in consultation with two oncologists, and include lung, GI cancers (except colon), and GU cancers (except prostate). In contrast, less aggressive cancers included breast, prostate and colon.

eTable 2. Physician and patient-caregiver interventions*

VOICE Physician Standardized Patient Intervention		VOICE Patient-Caregiver Coaching Intervention	
Before session #1, shortly after randomization	<p>Standardized patient-instructor (SPI) couple contacts the physician’s office to arrange logistics for two in-person sessions.</p> <p>Physician reviews a mock medical chart for “patient” with stage IV cancer.</p>	In-person coaching (60 minutes, occurring the same day or within a few days prior to an oncologist visit)	<p>Coach (a trained registered nurse or social worker) gives each patient and caregiver a Question Prompt List (QPL) – the My Cancer Care booklet developed and piloted for this intervention.²⁴</p> <p>The booklet suggests questions previously piloted with patients about diagnosis, prognosis, treatment options, symptom management, transitions in care, self-care, and family needs.⁷⁶⁻⁷⁹ It also lists items that “you would want your doctor to know about you” such as “I hate being dependent on others,” “I can deal with the truth about my condition,” “I would rather not discuss how much longer I have left,” and “When the time comes, I’d prefer to die at home.”</p> <p>Coach guides patient and caregiver through the booklet and asks to them to identify up to three key questions they’d like to ask the oncologist in the upcoming office visit.</p> <p>Coach offers support to help the patient formulate and ask questions, request clarification, express desire to participate in discussions about their care and prepare for the future.</p>
Session #1 (60 minutes)	<p>15- minute Educational DVD demonstrating 4 key evidence-based communication behaviors in advanced cancer</p> <p>15-20 minute mock office visit with standardized patients portraying a “patient” with stage 4 colon cancer and his “wife”</p> <p>Focused learner-centered feedback to oncologist on the 4 key skills.**</p> <p>Oncologist and SPIs come to agreement on 1-2 of the four skills to work on during the upcoming month.</p> <p>Oncologist receives a copy of the DVD to review, a pocket-sized card with key communication skills listed and copies of the patient <i>My Cancer Care</i> booklet.</p> <p>Wrap up and planning.</p>		At the oncologist visit
Between Sessions 1 and 2	<p>SPIs prepare and send written feedback to the oncologist about the mock office visit.</p> <p>Research assistant audio-records office visits of two real patients from the oncologist’s practice.</p> <p>SPIs listen to and provide written feedback on actual</p>

	patient visits.		
Session #2 (45-60 minutes), approximately 1 month later, after 1-2 study patients have completed patient coaching	<p>Review of prior session and feedback.</p> <p>15-20 minute mock office visit with the SPIs. The “patient’s” cancer has progressed further despite treatment.</p> <p>Feedback on the 1-2 key skills identified at the end of Session #1, with opportunity for discussion of the other skills if the oncologist wishes to do so.</p>	Follow-up phone calls (3-45 minutes each, timed to anticipate oncologist visits)	<p>Over the next three months, the coach makes three follow-up telephone calls to the patient and caregiver to check in, provide further reinforcement, strategize with about how to address the patient’s concerns if necessary and to identify new questions, at the patient’s discretion.</p> <p>Calls are timed to coincide with upcoming oncologist visits.</p> <p>Coach sends a summary and thank you letter to the patient.</p>

*Copies of the SPI and coach training manuals, fidelity instruments, the CD-ROM and materials distributed to patients, caregivers and physicians are available from the authors.

** Feedback was structured to match the four goals of the intervention, and to invite reflection and skill-building and to meet each individual learner’s needs. For each skill, the SPI first named the skill, asked the physician his/her intention (e.g. to transmit information, build rapport, etc.) then asked for brief self-critique followed by brief critique of the SPIs focusing on salient elements. For example, if an oncologist inquired whether the patient wished to know her prognosis, then kept talking and did not leave a silence, the SPIs might comment on the lack of space for a response as a barrier to communication. The physician would then be given the opportunity to “replay the tape” and practice doing the interview differently. The same principles were applied to SPI feedback from the live patient interviews that were audio-recorded.

eTable 3: Health care utilization in the final 30 days of life*

	Intervention	Criteria	Scoring	Total score
Aggressive treatment in the last 30 days of life	Chemotherapy	Initiation or continuation of IV or oral chemotherapy, excluding hormonal therapy	<ul style="list-style-type: none"> • within 14 days of death (2 points) • 15-30 days before death (1 point) • not at all (zero points) 	Sum of the points for all three indicators (0–6 points)
	Potentially burdensome interventions	Initiation of CPR, mechanical ventilation, tracheostomy, G-tube or J-tube placement, dialysis	<ul style="list-style-type: none"> • within 14 days of death (2 points) • 15-30 days before death (1 point) • not at all (zero points) 	
	Emergency department or hospital admission	Admission to Emergency Department or any unit in hospital except a palliative/hospice unit	<ul style="list-style-type: none"> • more than two (2 points) • two (1 point) one or • none (zero points) 	
Hospice utilization	Admission to a certified hospice organization.	Location of care can be home, comfort care home, skilled nursing facility and/or hospital. Exclusions: Non-hospice comfort care, palliative care and enhanced care.	Use/no use of hospice in last 30 days before death	Yes/no
			Hospice days from date of enrollment in hospice until death (truncated at 30 days)	0 – 30 Days

*Reliability was assessed through review of ten charts from each site and re-abstraction of 10 additional charts by trained 4th-year medical students, which revealed few inconsistencies which were all resolved by the PIs in favor of the original abstractions. Concerns about ambiguous or missing data were resolved by consensus of the investigators.

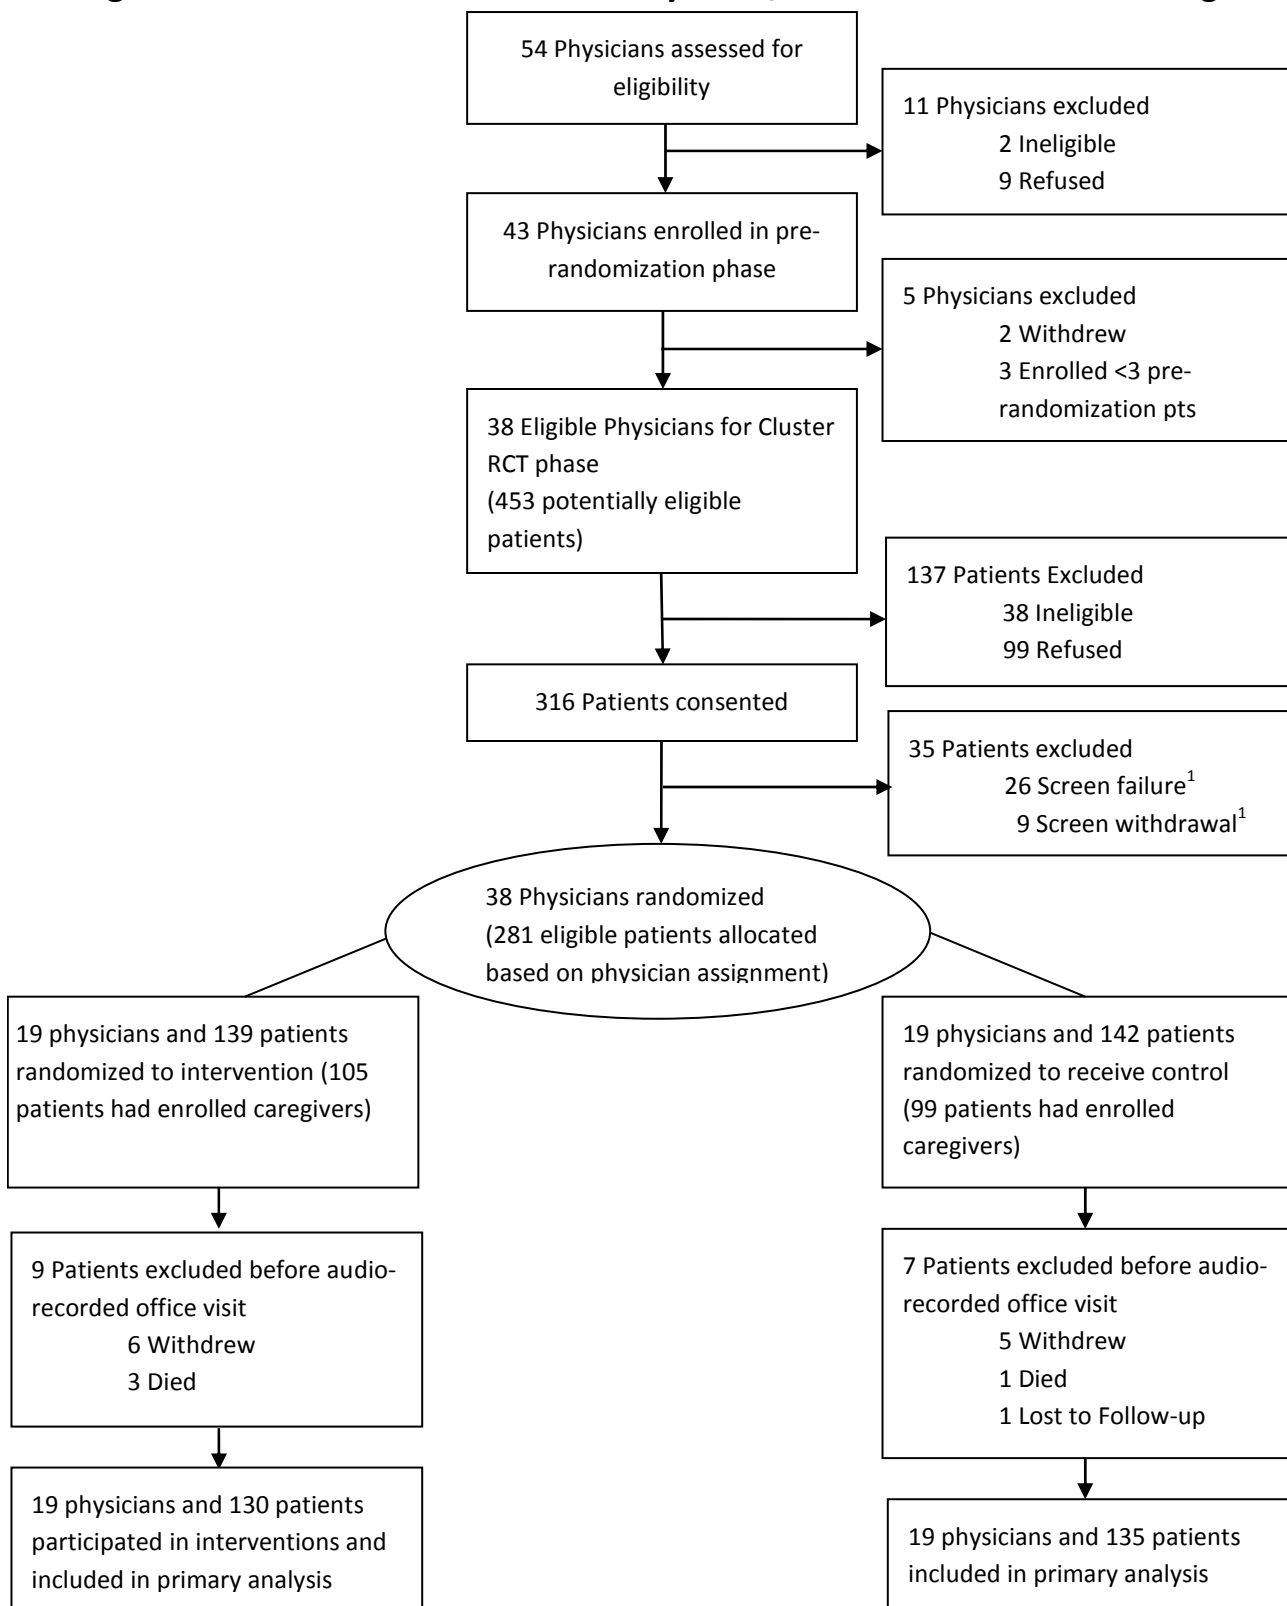

eTable 4. Raw scores for each of the component communication measures

	Pre-randomization*					Cluster RCT*					Difference in difference (Cluster RCT minus Pre-randomization)		
	Intervention (58)		Control (60)		Difference intervention minus control	Intervention (130)		Control (135)		Difference intervention minus control			
	Mean (std)	Range	Mean (std)	Range	Mean	Mean (std)	Range	Mean (std)	Range	Mean	unadjusted Mean difference	* adjusted mean difference (95% CI)	p-value
Mean of 4 z-scored key Aim 1a components	-0.1 (0.5)	2	0.1 (0.6)	2.4	-0.2	0.2 (0.8)	5.7	0 (0.7)	4.1	0.2	0.4	0.34 (0.06, 0.62)	0.017
ENGAGING outcome measure(APPC)**	12.2 (9.7)	45	14.4 (12)	0 - 54	-2.2	16.6 (12.7)	67	13.1 (11.4)	55	3.5	5.7	5.75 (0.72,10.77)	0.025
RESPONDING outcome measure(VERONA)	0.8 (1.4)	7	0.9 (1.7)	0 - 11	-0.1	1 (1.7)	11	0.5 (1)	7	0.5	0.6	0.51 (-0.1, 1.12)	0.102
INFORMING outcome measure (PTCC)** trimmed at 4	3.1 (3.6)	13	4.2 (5.1)	0 - 21	-1.1	4.3 (3.8)	14	4 (4.1)	19.2	0.3	1.4	1.39 (-0.3, 3.08)	0.107
FRAMING outcome measure (PTCC)**	0 (0.1)	1	0.1 (0.2)	0 - 1	-0.1	0 (0.3)	3	0.1 (0.3)	2	-0.1	0	0.03 (-0.08, 0.14)	0.591

* Each of the means and ranges refers to the number of codable statements made by patients (APPC) or physicians (VERONA and PTCC).

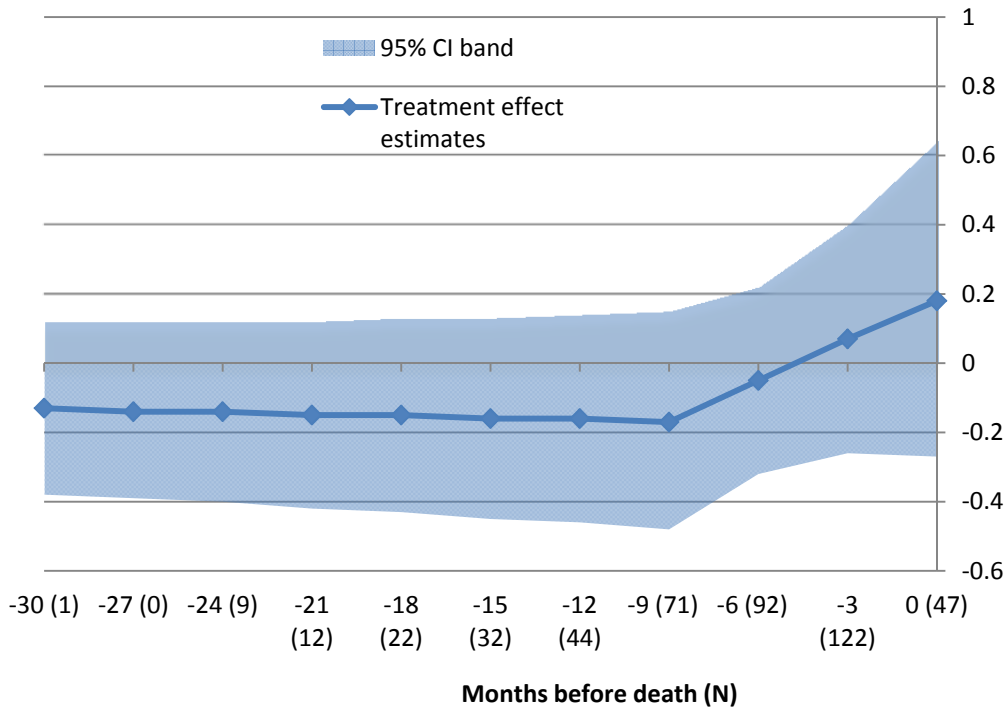

** Adjusted for site, breast cancer doctor, patient age, gender, race, education and aggressive cancer.

eFigure 1: VOICE STUDY Cluster RCT Physician/Patient CONSORT Flow Diagram

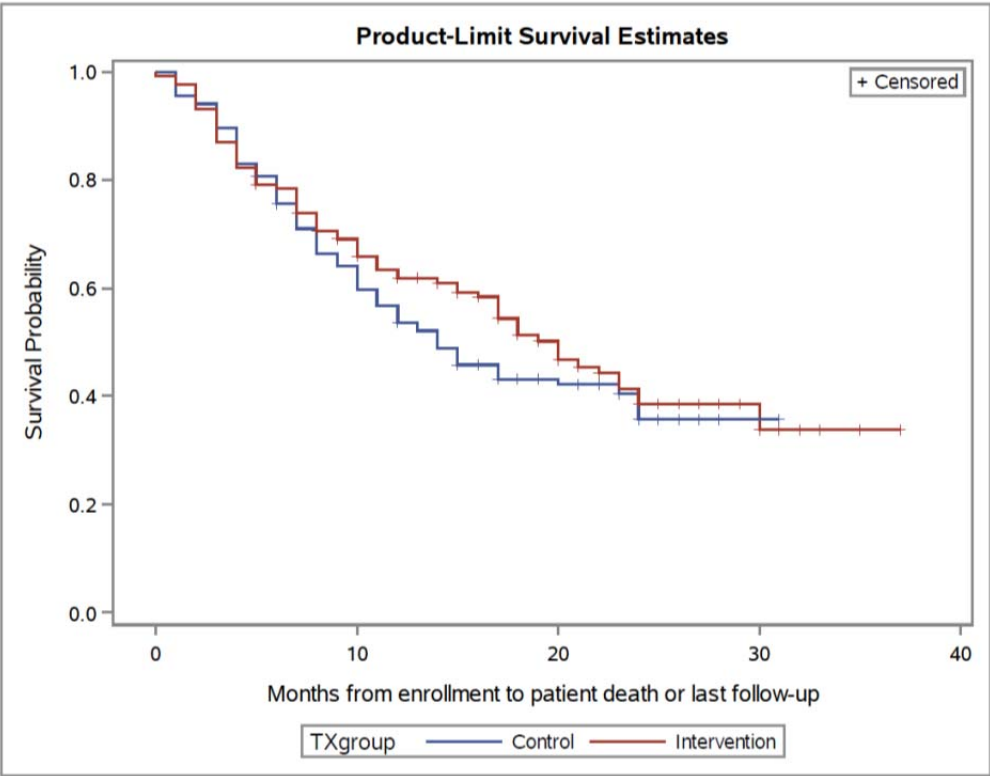

¹“Screen failure” = patient becomes ineligible after consent but before completing baseline survey (e.g. patient enters hospice care) and “Screen withdrawal”= consented but withdrew prior to completing baseline.

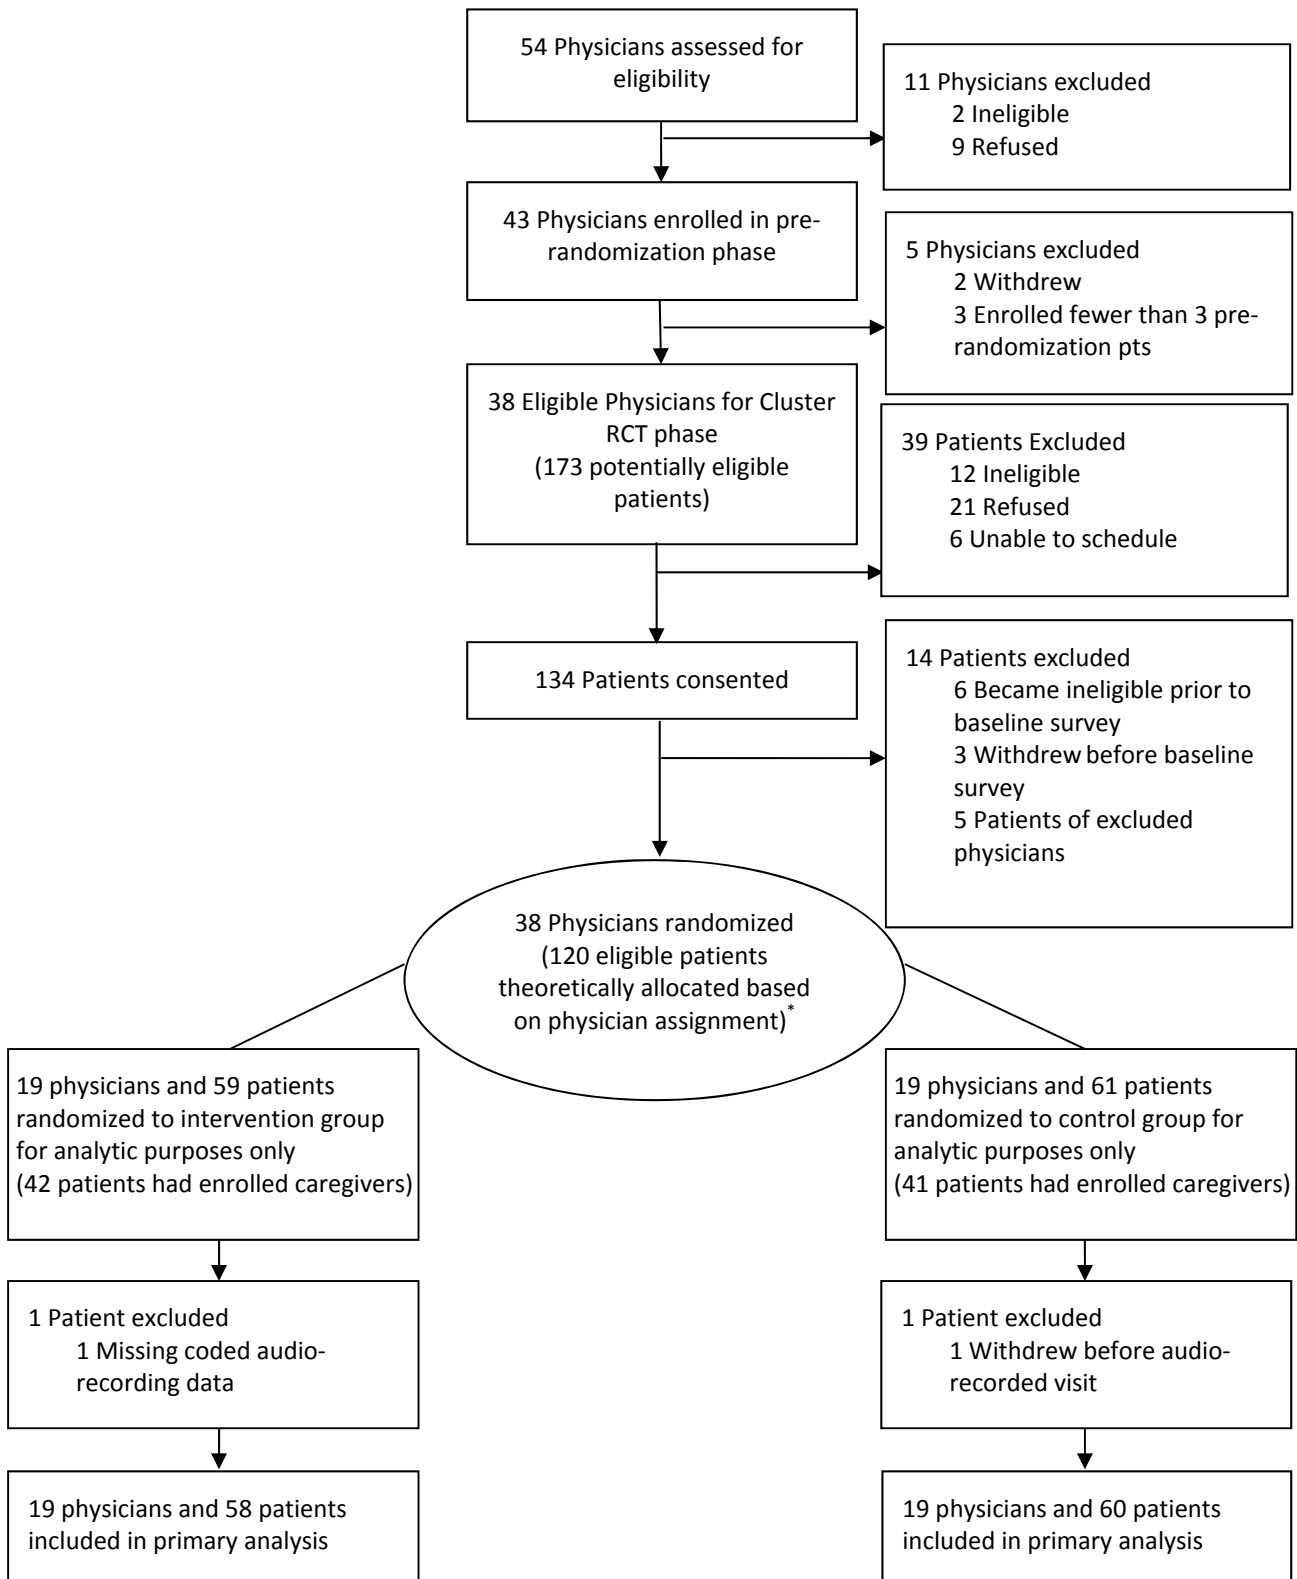

**eFigure 2: Quality of Life, Intervention vs Control:
Terminal Decline Model**

eFigure 3: Kaplan-Meier Survival Curve: Intervention and Control

eFigure 4: VOICE Study CONSORT Diagram: Pre-randomization Sample

*For analytic purposes, patients were retroactively allocated to intervention or control based on their physician's subsequent assignment.
