

Additional File 3. Triticeae MPK and MKK accessions and nomenclature. Six tables are presented below one for each species: *Triticeae aestivum* (pages 2-5), *Hordeum vulgare* (pages 6-7), *Secale cereale* (page 8), *xTritosecale* (page 9), *Aegilops tauschii* (page 10), *Triticum urartum* (page 11). Nucleotide accessions were collected from various databases as indicated in the footnote for each table. Translated sequences from nucleotides marked in bold were used for phylogenetic analysis (Figs 1, 2 and 3, and Additional File 11).

Notes:

- Nucleotide** - Accessions were collected from EP (Ensembl Plants, <http://plants.ensembl.org/index.html>), GB (GenBank, <https://www.ncbi.nlm.nih.gov/genbank/>), or TRI (Triticeae Full-length CDS database, <http://trifldb.psc.riken.jp/v3/index.pl>). Abbreviated nucleotide identifiers were used for EP accessions (for full gene identifiers refer to Additional File 2) which should be preceded with 'TRIAE_CS42_CN_TGACv1_,' where CN refers to the chromosome number as defined under location. In some cases where nucleotide sequences were identified in EP, accessions were not available—in these instances, genomic locations are provided under Nucleotide instead. Sequences for which alternative splicing is proposed are include the suffix 'X' at the end of the nucleotide identifier.
- Loc (location)** - Gene sequence were located on chromosomes 1-7 of the A, B and D genomes of *Triticum aestivum*. U refers to unknown location, where U is followed by a number if more than one orthologue was identified with unknown location. Location is not available (-) for sequences obtained from GB or TRI.
- Protein** - GB or UniProt (Ensembl) protein accessions.
- Reported Names** - Other names that have been assigned in GB, EP or according to references (marked with superscript numbers). EP names were assigned to the genes where MPKs and MKKs are spelled out ('mitogen activated protein kinase' and 'mitogen activated protein kinase kinase', respectively; note that in some cases UniProt sequence was assigned a different MPK/MKK number than that assigned to the gene).

Notes:

- Nucleotide** - Accessions were collected from EP (Ensembl Plants, <http://plants.ensembl.org/index.html>), GB (GenBank, <https://www.ncbi.nlm.nih.gov/genbank/>), or HW (Harvest-Web, <http://harvest-web.org/hweb/utilmenu.wc>). For nucleotide sequences identified in EP, but accessions were not available, genomic locations are provided instead, and marked with an asterisk. Sequences for which alternative splicing is proposed are include the suffix 'X' at the end of the nucleotide identifier.
- Loc** (location) - Gene sequence were located on chromosomes 1-7 of H genome (*Hordeum vulgare*). Location is not available (-) for sequences obtained from GB or HW.
- Protein** - GB or UniProt (Ensembl) protein accessions.
- Reported Names** - Other names that have been assigned in GB, EP or according to references (marked with superscript numbers). EP names were assigned to the genes where MPKs and MKKs are spelled out ('mitogen activated protein kinase' and 'mitogen activated protein kinase kinase', respectively; note that in some cases UniProt sequence was assigned a different MPK/MKK number than that assigned to the gene).
