

# Supplementary Materials: *Bacillus subtilis* Type I antitoxin SR6 Promotes Degradation of Toxin *yonT* mRNA and Is Required to Prevent Toxic *yoyJ* Overexpression

Celine Reif, Charlotte Löser and Sabine Brantl

**Figure S1:** RT PCR on *gapA* RNA. Total RNA of *B. subtilis* DB104 grown until OD<sub>600</sub> = 3.0 was isolated and used for RT PCR. Chrom. DNA = genomic DNA used as positive control. Total RNA was used as negative control.

**Figure S2:** Calculation of the amounts of *yonT* RNA and SR6 using standard curves (shown above) obtained by loading and Northern blotting of defined amounts of *in vitro* synthesized *yonT* RNA and SR6 in the range of 0.01 to 5 fmol in parallel onto the gels with RNA samples from cultures grown in TY, CSEG and CSE medium (see Figure 3 in the main body of publication).

**Table S1:**  $\beta$ -galactosidase-activities of translational *yonT-lacZ* and *yoyJ lacZ* fusion strains.

Strain	optical density	$\beta$ -galactosidase activity (MU)
DB104 ( <i>amyE::pGAY1</i> )	1.0	4.3±1.4
	3.0	6.6±1.8
	5.0	10.8±2.1

DB104 ( <i>amyE::pGAB1</i> )	1.0	3.1±0.7
	3.0	3.4±1.3
	5.0	7.2±1.7
1A100 ( <i>amyE::pGAY1</i> )	1.0	5.3±1.1
	3.0	7.0±2.0
	5.0	13.8±1.5
1A100 ( <i>amyE::pGAY2</i> )	1.0	4.1±1.1
	3.0	7.5±2.0
	5.0	11.5±1.8
1A100 ( <i>amyE::pGAB1</i> )	1.0	2.9±0.9
	3.0	5.8±2.2
	5.0	8.2±2.4

*B. subtilis* strains were grown in TY medium, and at the indicated optical densities, samples were withdrawn and used for  $\beta$ -galactosidase measurements. Averages of three independent measurements with standard deviations are shown. Whereas DB104 expresses SR6 from a single-copy in the chromosome, 1A100 lacks the SP $\beta$ 1 prophage and therefore, the *sr6* gene.
