

Supplementary Figure S3 Serum hormone levels following 36 months of Control (C), Testosterone (T), western-style diet (WSD) and T + WSD treatment. Fasted serum leptin (A), adiponectin (B), ghrelin (C) and C-reactive protein (CRP) (D) values were collected immediately prior to the 36-month glucose tolerance test. Values presented are the mean \pm SEM with $n = 10$ /group. Two-way ANOVA effects are presented as text within the graphs. Different letters denote significant differences between groups.
