## **Supplementary Text:**

### **Additional Results:**

Over 200 results were observed in each filter category. There were 25 results that showed Bonferroni significant associations with All Variants as well as with all functionally annotated filters. A total of 17 results were observed only in variants filtered by functional annotation before burden testing, not in all variants nor non- functionally annotated filtered variant based associations, highlighting the importance of functional annotation of specific variants in the associations. We observed 13 associations shared among functional annotation Filter 2 and 3, and 8 associations for functional annotation filter 2 and 3 only, which suggests the importance of the specific type of annotation filtering for those associations. The least overlap in various filtering approaches was between the non-functionally annotated -filtered data (no low frequency variants with putative functional impact) and the other filtering approaches. There were 37 gene-phenotype associations (among those with P-value< 0.001) in both the non-functionally annotated filtered data and 'all variants'. There was one association shared across the non-functionally annotated filter based associations as well as functional annotation filter 3.

Next, we further inspected associations that were unique to each filtering approach. **Table** below provides the unique count of associations that are observed exclusively in each filtering category. We noted that among the annotation filtering approaches, the most significant as well as unique associations were observed in functional annotation filter 2 category (176).

**Table: Number of associations observed uniquely for each variant filtering approach, where results were not significant with P-value < 0.001 in any other categories, shown with ascending order of count.**

Filter Category	Count
Non-functionally annotated Variants	201
Functional Annotation Filter 2	176
All Variants	88
Functional Annotation Filter 3	72
Functional Annotation Filter 1	63

## **Data Visualization**

Plot 2 and Supplementary figures 1, 2 and 3 are generated using circos perl package<sup>75</sup>.

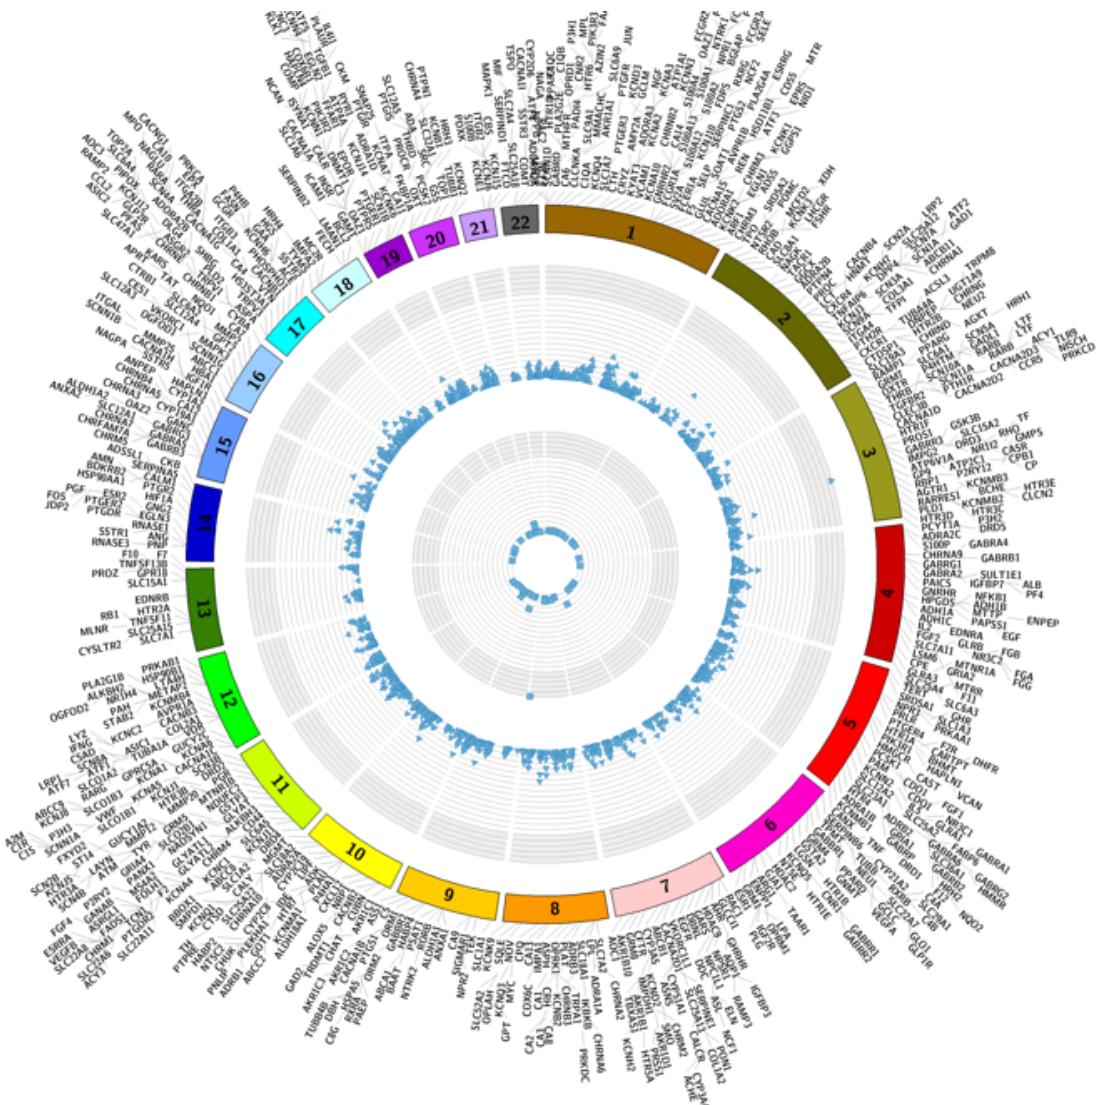

Plots 10 and 12 are generated using UpSetR package in Shiny<sup>76</sup>.

Plots 11 and 13 are generated using Synthesis- View<sup>51</sup>

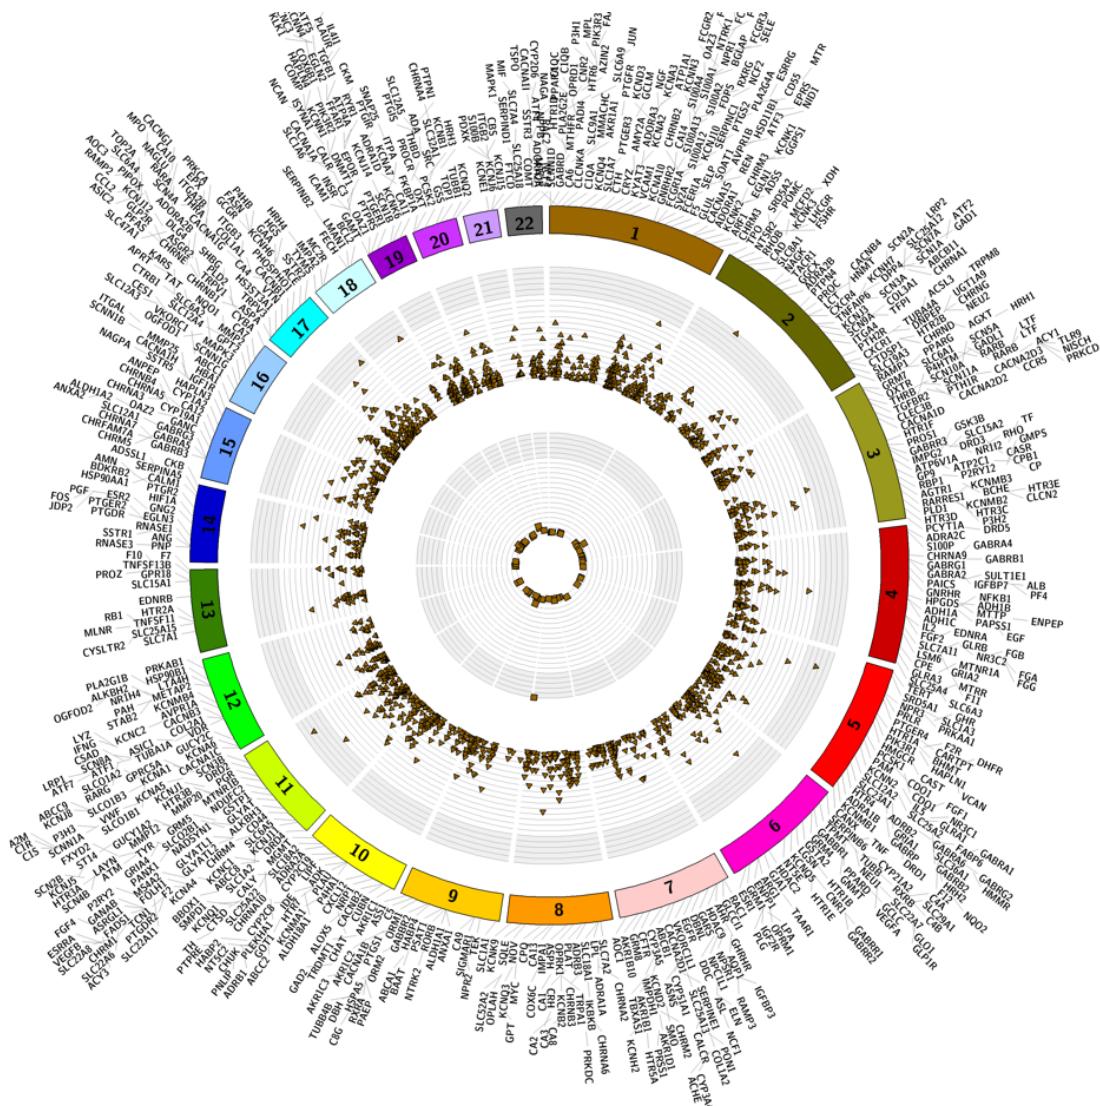

Plot 14 are generated using Phenogram package<sup>77</sup>

## **Supplementary Figures:**

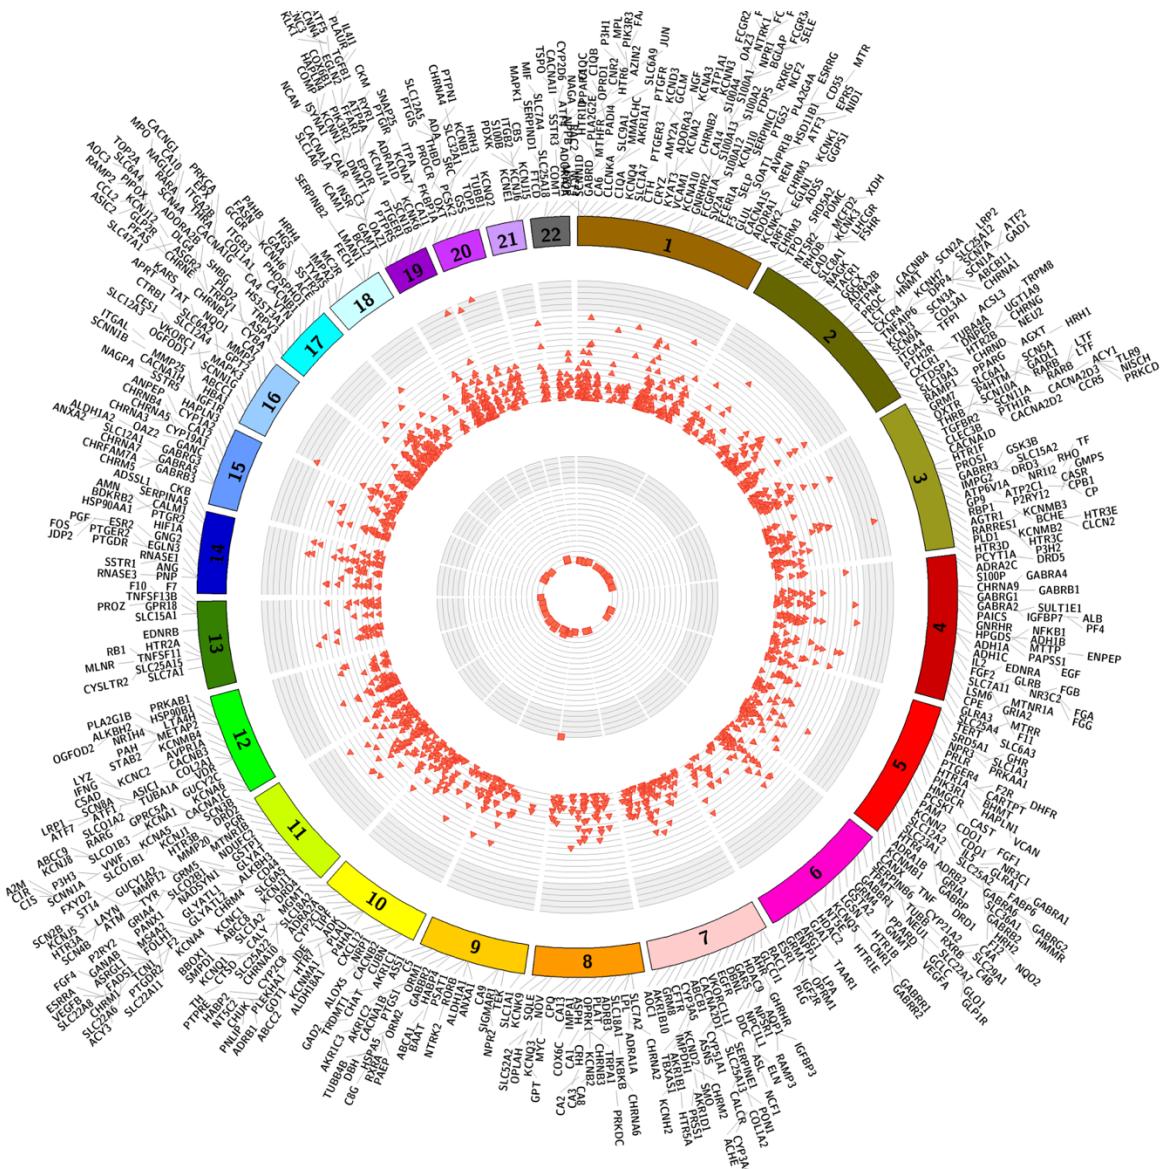

Supplementary Figure 1: Circos plot for Functional Filter 2 category

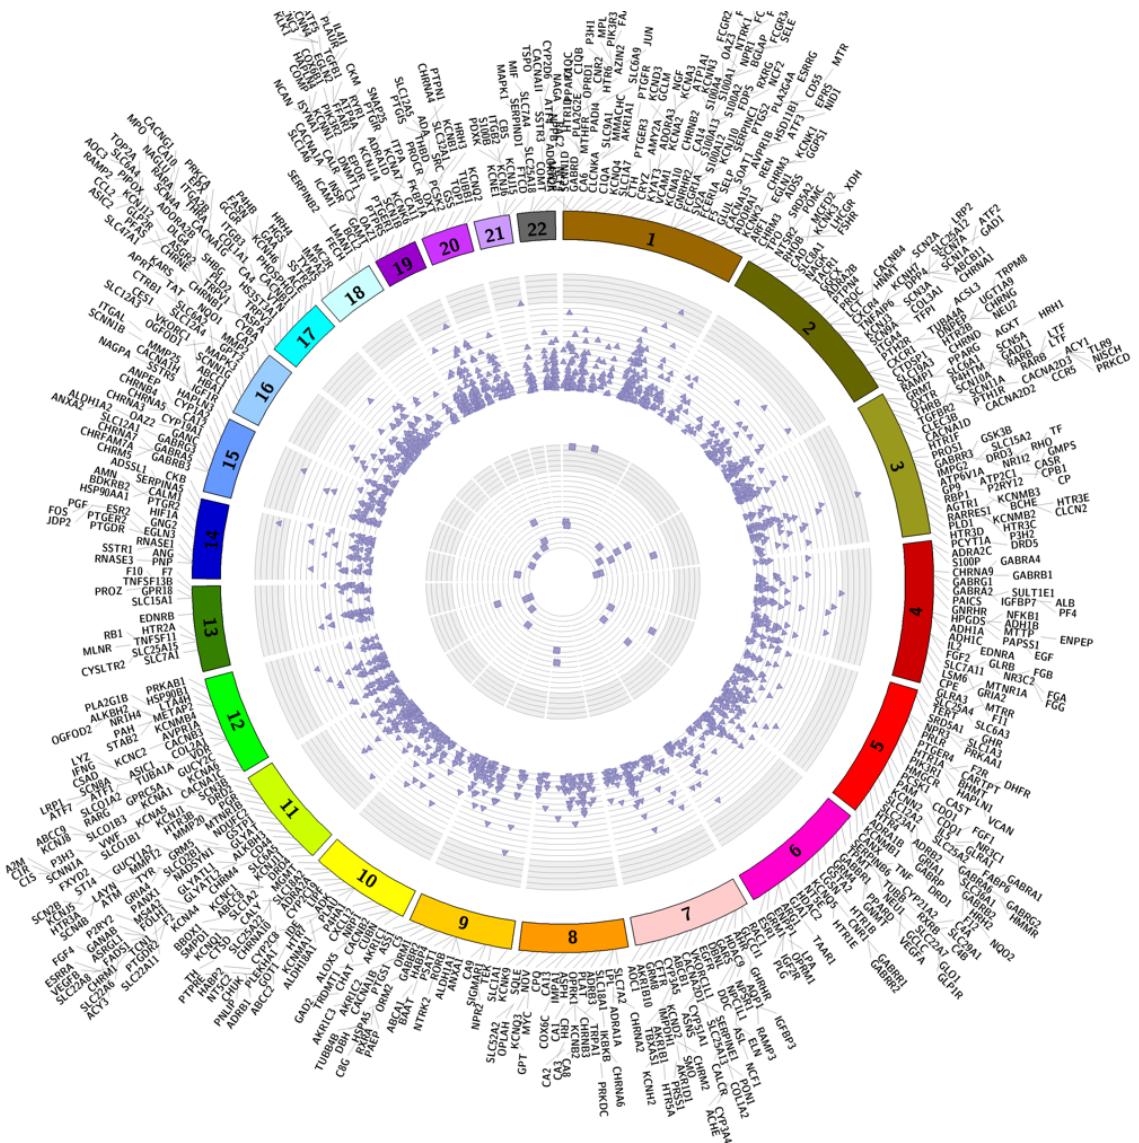

## Supplementary Figure 2: Circos plot for Functional filter 3 category

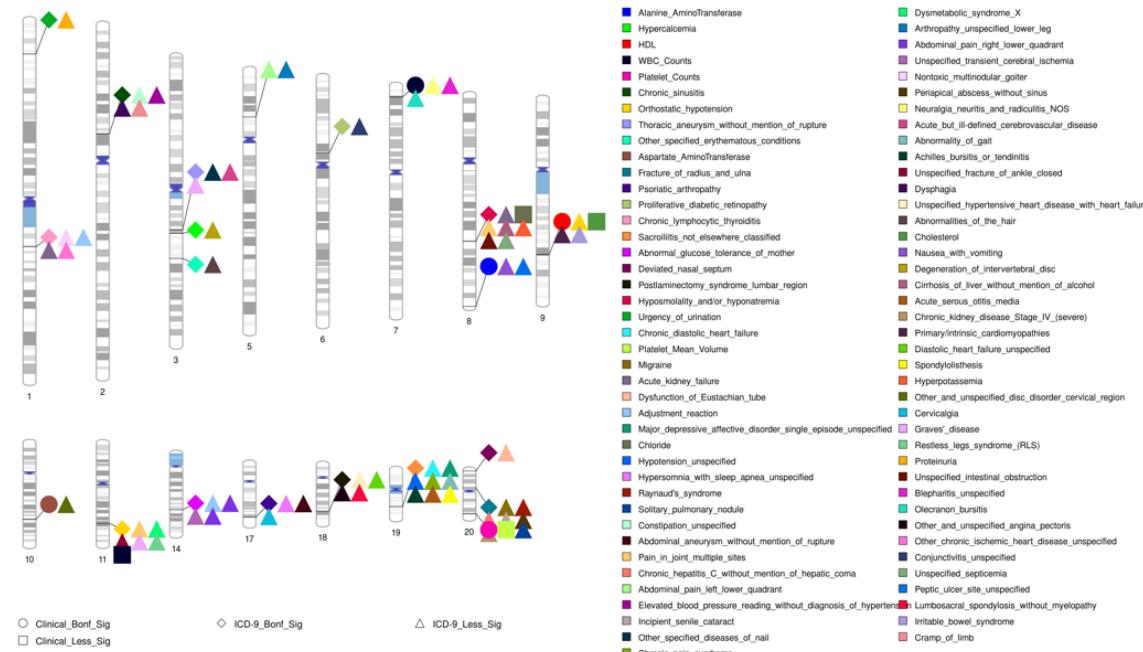

### Supplementary Figure 3: Circos plot for All variants category

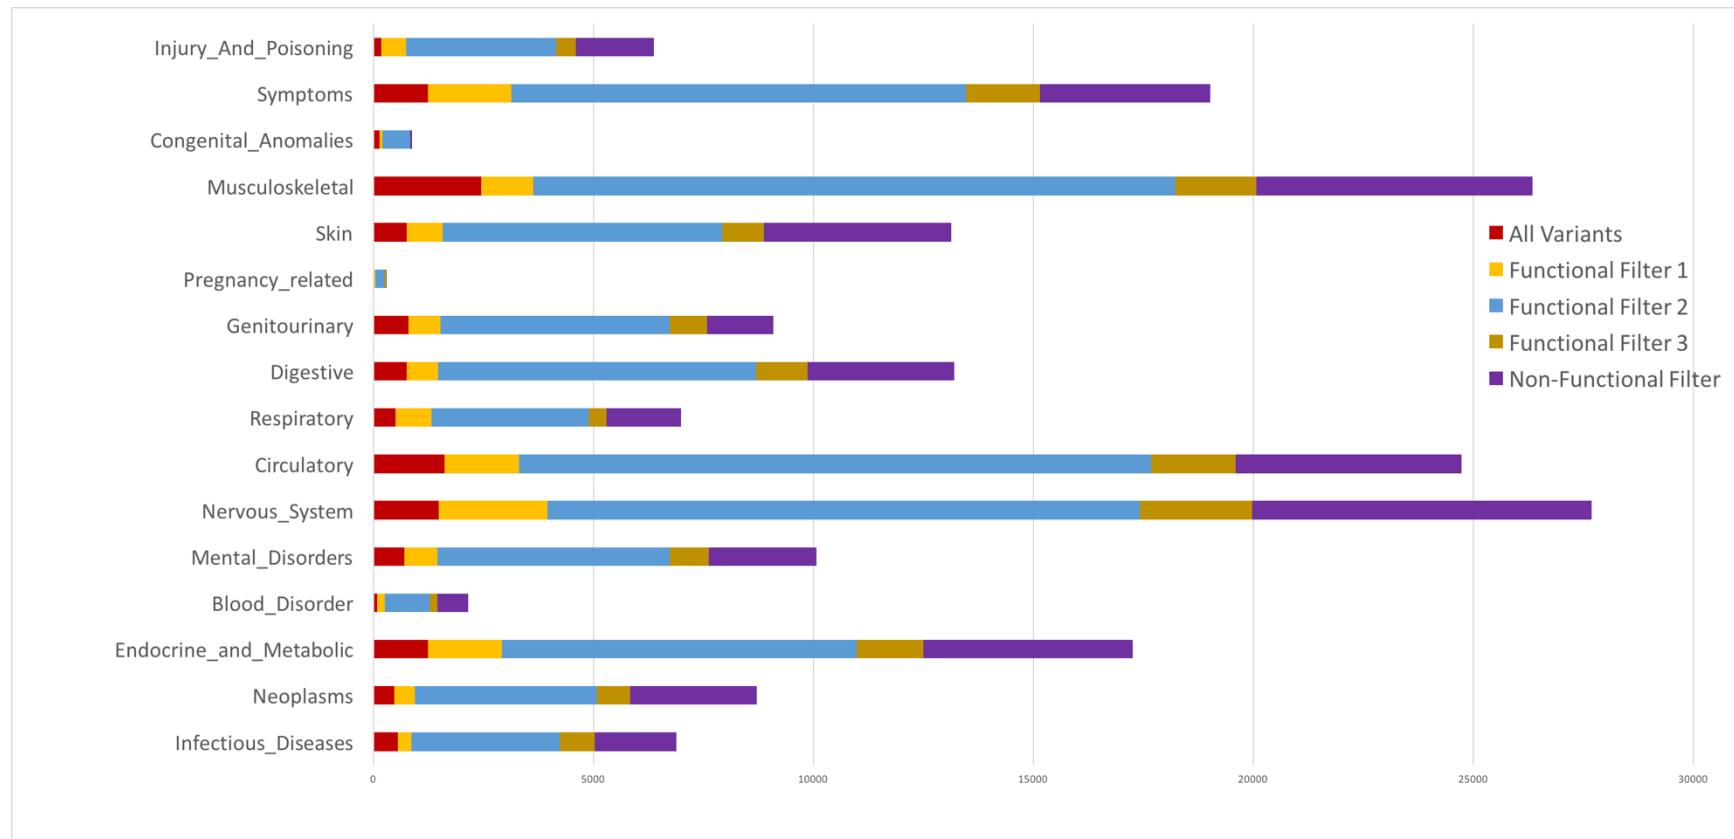

## Supplementary Figure 4: Circos plot for Non-functional Filter category

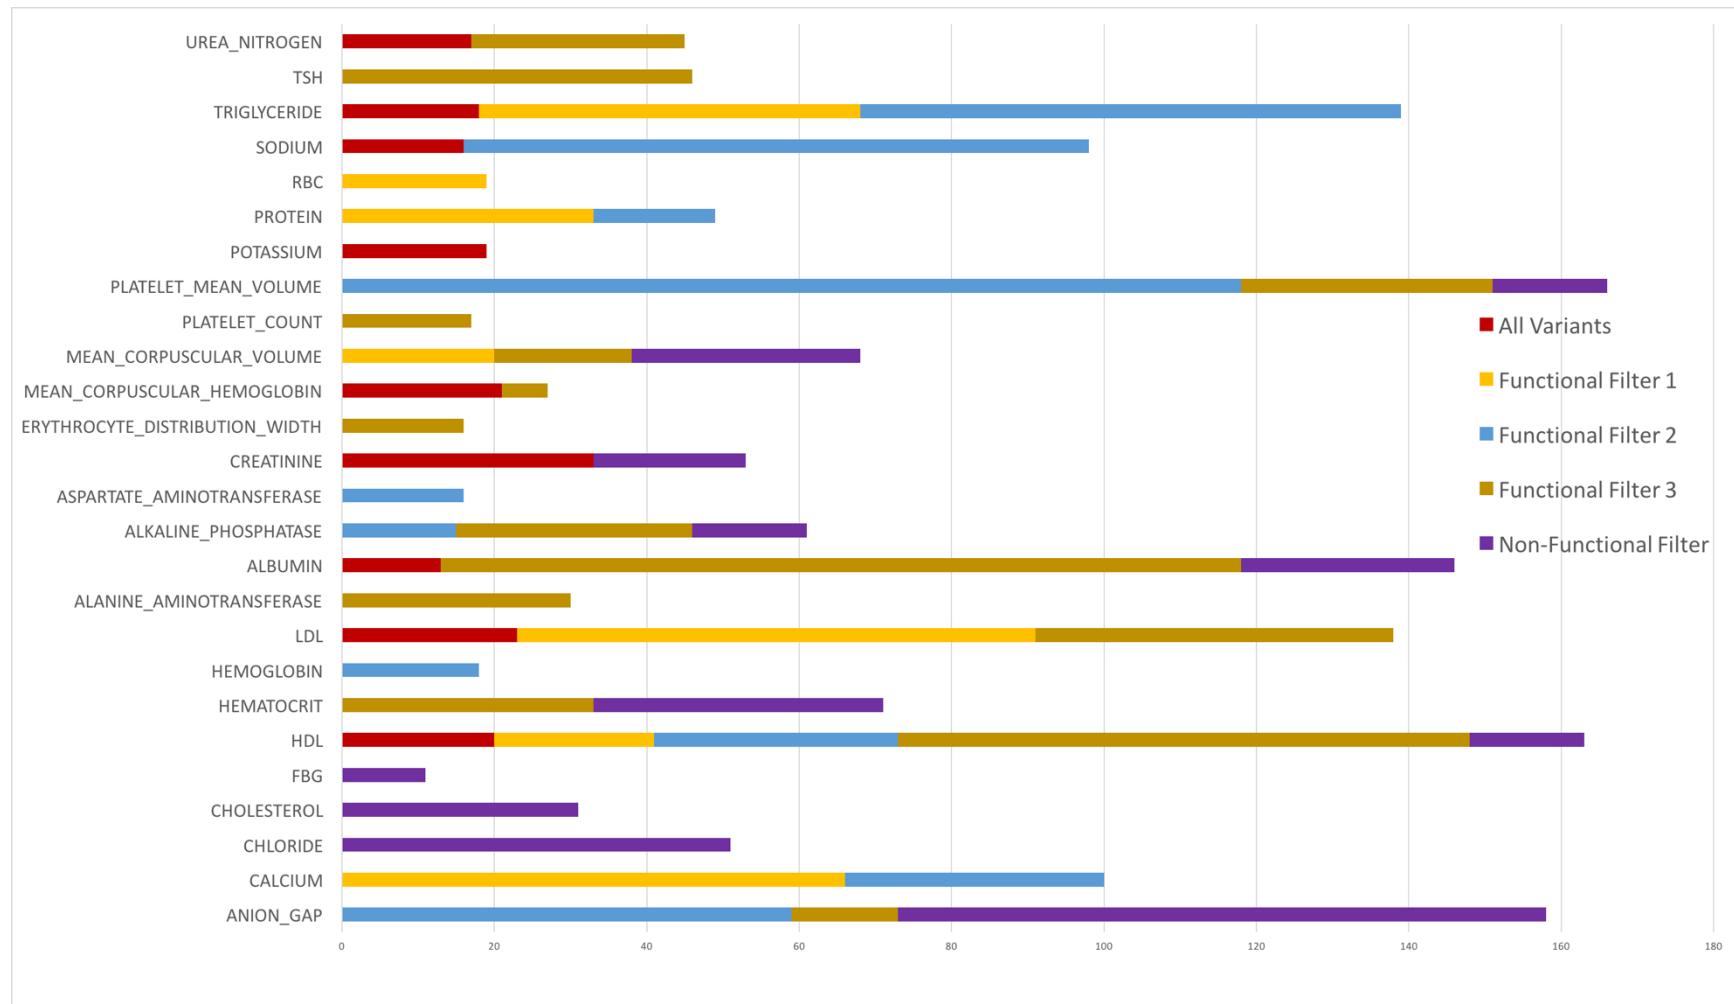

**Supplementary Figure 5: Phenogram plot representing cross-phenotype associations from results with P-values < 1e-08. Shapes correspond to ICD-9 code description or Laboratory measurements for both results that are Bonferroni significant and P-value<1e-04 significant**

**Supplementary Figure 6: Count of results below FDR q-value 0.25 from GSEA for ICD-9 codes**

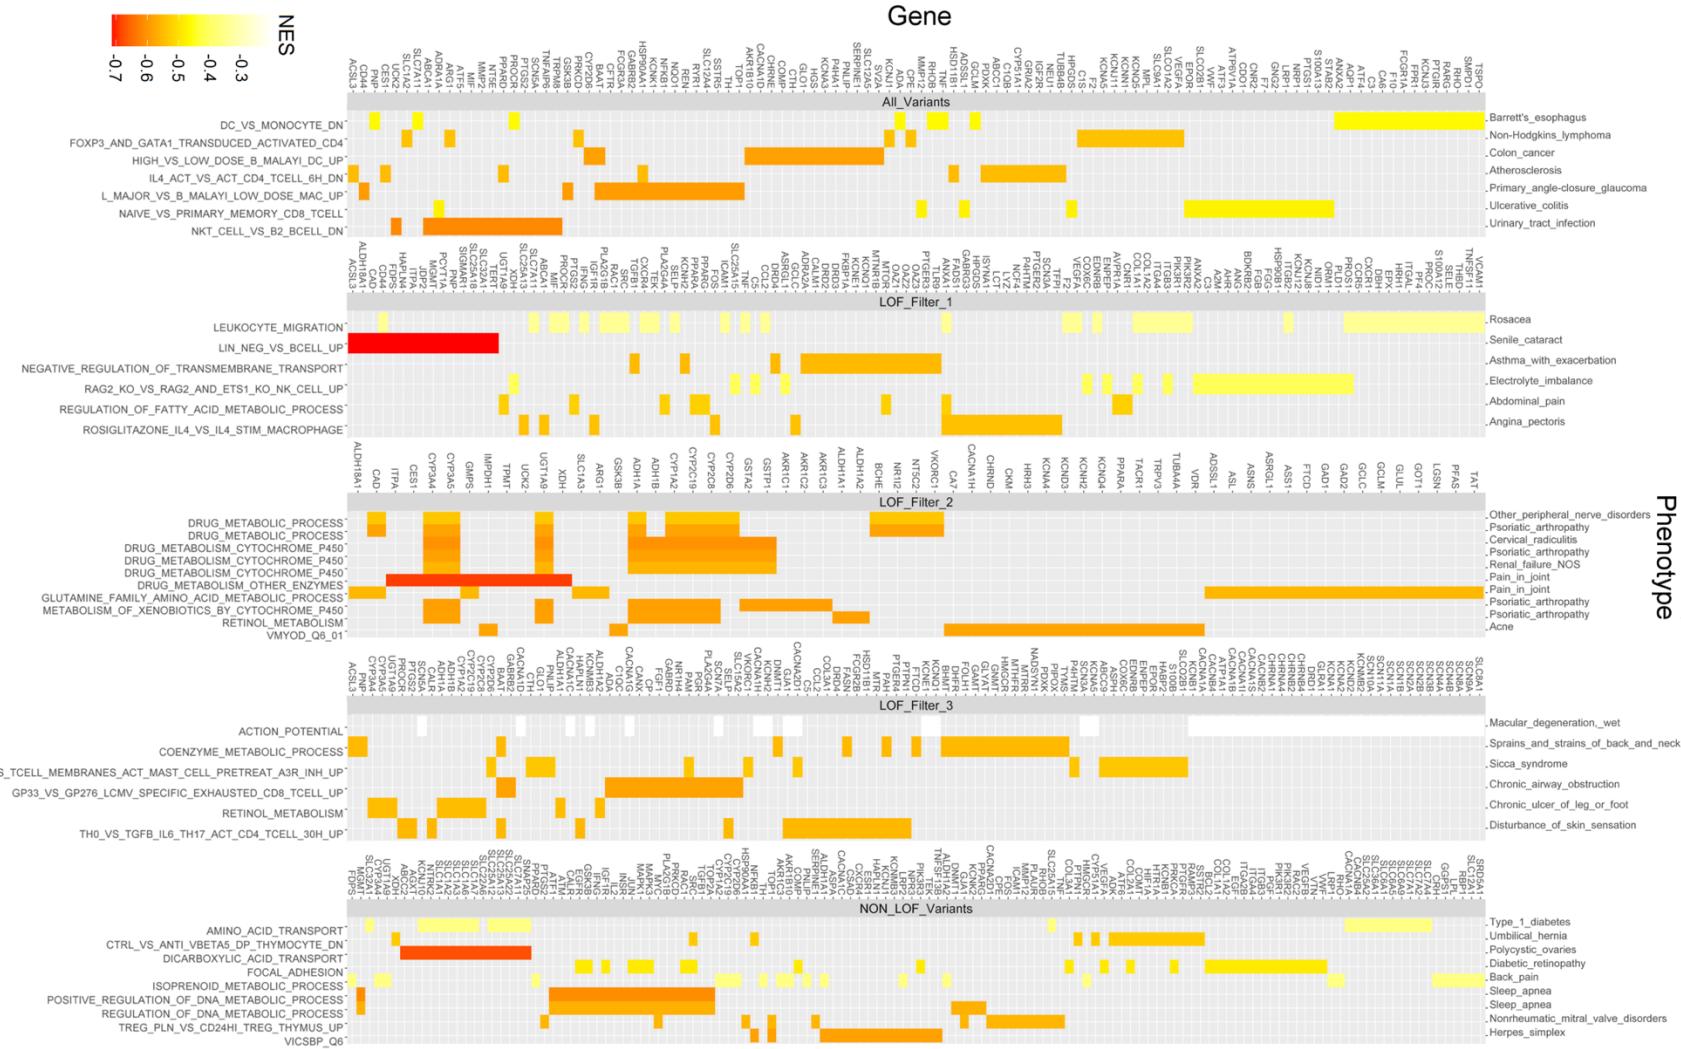

**Supplementary Figure 7: Count of results below FDR q-value 0,25 from GSEA for Clinical laboratory measurements**

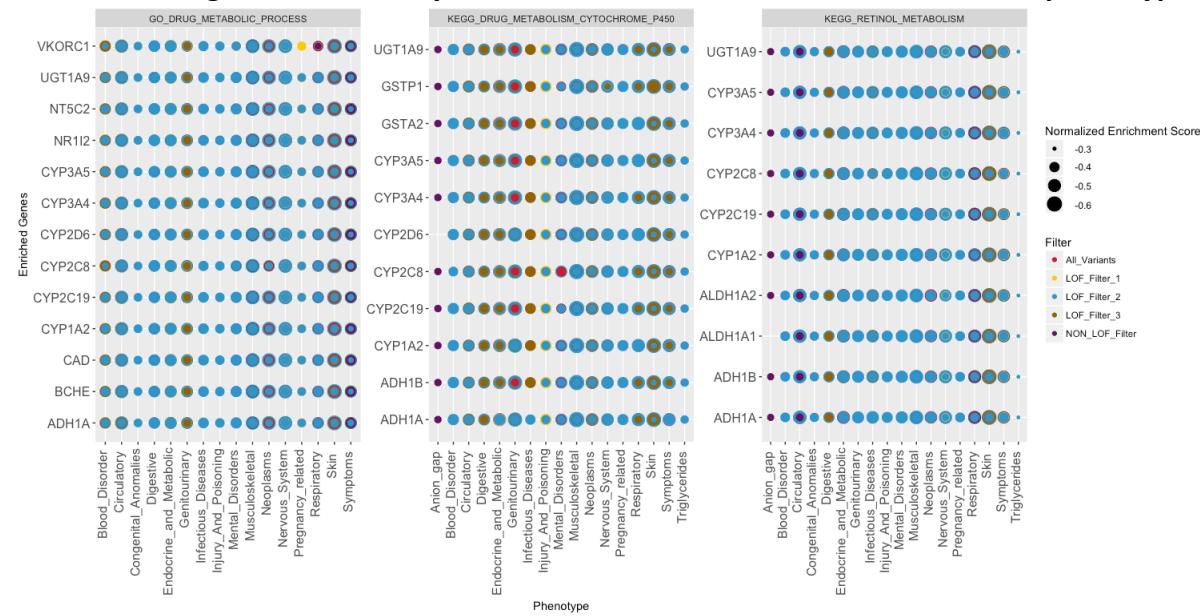

**Supplementary Figure 8: Heat map of GSEA results where FDR q-value=0. These results are separated by LOF filter category. X-axis is the gene name and Y-axis represent combination on Phenotype (on right) and Gene-set (On left). Gradient of color corresponds to the normalized enrichment score (NES).**

## Enriched Gene Set

**Supplementary Figure 9: The top 3 enriched gene sets along with the genes that are found to be enriched in these pathways. The size of the points corresponds to the normalized enrichment score, and the color corresponds to the Filter type from the tests. X-axis labels are gene names and y-axis labels are clinical lab measures or ICD-9 phenotype categories**

**Supplementary Table 1: Bonferroni Significant Results**
