

BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

Abstract

Objectives

To design a questionnaire and use it to explore unmet needs with practical aspects of medicines taking after stroke, predictors of medicine taking and to estimate the proportion of survivors who get support with daily medication taking.

Design

Four workshops with stroke survivors and caregivers to design the questionnaire.

A cross-sectional postal questionnaire in primary care.

Setting

18 GP practices in the East of England and London. Questionnaires posted between September 2016 and February 2017.

Participants

1687 stroke survivors living in the community outside institutional long term care.

Primary Outcome measures

The proportion of community stroke survivors receiving help from caregivers for practical aspects of medicine taking; the proportion with unmet needs in this respect; the predictors of experiencing unmet needs and missing taking medications.

Results

A 5-item questionnaire was developed to cover the different aspects of medicine taking. 596/1687 (35%) questionnaires were returned. 56% reported getting help in at least one aspect of taking medication and 11% needing more help. 33% reported missing taking their medicines. Unmet needs were associated with receiving help with medications (OR: 5.6, $p<0.001$), being on a higher number of medications (OR: 1.2, $p<0.001$) and being dependent for activities of daily living (ADL) (OR: 4.9, $p=0.001$). Missing medication was associated with having unmet needs (OR: 5.1, $p<0.001$), receiving help with medications (OR: 2.1, $p<0.001$), being on a higher number of medicines (OR: 1.1, $p=0.008$) and being older than 70 years (OR: 0.6, $p=0.006$).

Conclusions

More than half of patients who replied needed help with taking medication and 1 in 10 had unmet needs in this regard. Stroke survivors dependent on others have more unmet needs, more likely to miss medicines and might benefit from focused clinical and research attention. Novel primary care interventions focusing on the practicalities of taking medicines are warranted.

Article summary

Strengths and Limitations

- A 5-item questionnaire was developed to evaluate the help stroke survivors get with daily medication taking, based on patients' and caregivers' own views gathered through workshops.
- The questionnaire was sent to 1,687 stroke survivors in 18 GP practices across two UK regions.
- This work identified issues from a population that includes patients severely affected by stroke, who are often excluded from research. Results shed light on the effect of stroke related impairments on practical domains and predictors of medicine taking, which have significant effects on overall adherence and call for new primary care interventions.
- The low response rate reported is a limitation of this study and stroke survivors who are harder to reach may have been missed.

Funding: This study was funded by the RCGP SFB, Ref. SFB 2014 – 15 'Quantifying the support stroke survivors get with daily medication taking: a questionnaire survey'. Anna De Simoni and Luis Ayerbe are funded by a NIHR Academic Clinical Lectureships. This article therefore presents independent research funded by NIHR. The views expressed are those of the authors and not necessarily those of the NHS, the NIHR, or the Department of Health. James Jamison was supported by a research grant from The Stroke Association and the British Heart Foundation: TSA BHF 2011/01

7 8 Introduction 9

10
11 For many older adults remaining independent at home may depend on how well they can manage
12 complex medication regimens.^{1,2} Around half of stroke survivors are dependent on others for everyday
13 activities.³ Stroke is the leading cause of disability in developed countries, with an estimated that 25-74% of
14 the 50 million stroke survivors worldwide requiring some assistance or being fully dependent on caregivers for
15 activities of daily living (ADL's).⁴⁻⁶
16
17
18
19
20

21 There is evidence that being dependent for ADL's and impairment in mobility and communication
22 decrease medication adherence in patients suffering from hypertension.⁷ Deficits in attention, cognition or
23 working memory have been linked with non-adherence to medications in other patient groups.⁸ In a recent
24 systematic review of medication adherence among patients with cognitive impairment, one third of studies
25 showed that such patients were likely to have a caregiver to assist with medications and there was an
26 association between taking four or more medicines and nonadherence.⁹ In patients taking cardiovascular
27 medicines, multiple factors including cognitive problems, lack of social support, dosing regimen, as well as
28 practical problems and difficulties accessing services, contribute to poor medication adherence.^{10, 11} Low
29 adherence to secondary prevention medication is associated with poor cardiovascular health.^{12, 13}
30
31
32
33
34
35
36
37
38

39 Stroke survivors have previously reported difficulties in the handling of medication as a barrier to
40 adherence to secondary prevention medication after stroke.¹⁴ Research on medication adherence in stroke has
41 identified multiple barriers to medication taking among stroke survivors.¹⁴⁻¹⁶ However interventions developed
42 to improve adherence have mainly concentrated on patients responsible for their own medicine taking.^{17, 18}
43
44
45
46

47 In elderly patients in particular, cognitive deficits, taking large number of medicines and the
48 complexity of medication regimens have been identified as barriers to medication adherence.^{19, 20} Caregivers
49 are known to play a key role in providing assistance to older people in a range of daily activities including
50 medication taking and physician visits,²¹ and can help improve adherence in cardiac patients with memory
51
52
53
54
55
56
57
58
59
60

1
2
3 problems.²² However, the proportion of community stroke survivors relying on caregivers for some, or all
4 aspects of medicine taking, is not known.
5

6
7 Survivors of stroke have previously reported unmet needs including physical difficulties, cognitive
8 and emotional difficulties, information needs and other unmet needs.^{23 24} However we know little about factors
9 that influence medication taking among stroke survivors with disabilities living in the community (i.e. not in
10 nursing homes), their unmet needs around the use of medicines or the proportion relying on caregivers for
11 some or all aspects of medicines taking.
12

13
14 To date, survey instruments examining the unmet needs of stroke survivors have not focused on aspects of
15 medication taking.
16

17
18 The aims of this investigation were to design an instrument to evaluate the help stroke survivors get
19 with taking their medicines, characterise patients receiving help with medications, estimate the proportion who
20 have unmet needs with daily medicine taking and who miss medications. We additionally aimed to identify the
21 predictors of missing medicines and of experiencing unmet needs with medications.
22

23
24 This knowledge can inform the development of primary care interventions aimed at improving medication
25 taking in this patients' group.

Methods

Questionnaire development workshops

To develop the questionnaire, three workshops were conducted with 26 stroke survivors and 12 caregivers in the East of England (St John's College, Cambridge 2009²⁵: 7 patients, 1 caregiver; Different Stroke, Cambridge 2012: 9 patients, 3 caregivers; Peterborough, 2012: 10 patients, 8 caregivers). Recruitment was opportunistic and no purposive sampling was applied.

The survey questions were developed through thematic analysis²⁶ of workshops field notes.

A fourth workshop was conducted to gather feedback on the questionnaire using a PPI (Patient and Public Involvement) exercise with 11 stroke survivors and 3 caregivers recruited through a local stroke group (Different Strokes, East of England). Two stroke survivors from this group took part in subsequent 'think-

1
2
3 aloud' interviews, which involved talking out loud as they read the questionnaire, continually verbalising what
4 they were thinking.
5

6 **Postal survey**

7
8
9 General practices in primary care in the East of England and London were approached through the
10 Clinical Research Network (CRN). CRN Eastern contacted 20 GP practices, of which 11 replied and took part
11 in the study. CRN North London contacted 140 GP East London practices by email (Tower Hamlets, Newham
12 and City & Hackney CCGs), of which only two replied and participated in the study. Five of the eight GP
13 practices contacted in North London (Barnet CCG) through a research coordinator took part in the study.
14
15
16
17

18 Patients with stroke and their caregivers were sent the postal questionnaire according to the following criteria
19
20
21

22 Inclusion Criteria

23
24 Patients:

25
26 All patients aged > 18 on the practice stroke register with documented history of stroke.
27
28

29 Caregivers:

- 30
31
- 32 • Anyone identified by the patient as being a caregiver and having a role helping with medicine taking.
- 33

34 Exclusion Criteria

- 35
36
- 37 • Patients who suffered a Transient ischaemic attack (TIA) but not a stroke.
 - 38 • Palliative or end of life patients.
 - 39 • Patients receiving institutional long term care (receiving total care in residential homes or living in
40 nursing homes).
- 41
42
43
44

45 **Survey participant identification**

46
47 A list of prospective patients was compiled from the stroke register of each surgery by the practice
48 staff. No restriction was placed on the recruitment of survivors experiencing who were dependent for ADL's
49 or lacking capacity. The list was screened by a practice GP and anyone not meeting the inclusion criteria or
50 whom the GP considered unsuitable for the study (e.g. terminally ill) was excluded.
51
52
53
54

55 **Survey participant recruitment**

1
2
3 Eligible participants were sent a study survey pack by practice staff between September 2016 and
4 February 2017. Study recruitment packs included two invitation letters, patient information sheets,
5 questionnaires and postal version of Barthel Index²⁷, one of which was for completion by the patient and the
6 other by the caregiver. The Barthel Index provides a measure of functional independence and physical
7 functioning and has been used in stroke research previously.²⁸ Patients with Barthel score <20 were
8 categorised as dependent for ADLs/disabled. If receiving help with medications, the patient was asked to pass
9 to their caregiver the invitation letter and information sheet and invite him/her to complete their copy of the
10 questionnaire, providing answers on the patient's medicine taking. Family members, friends or paid caregivers
11 of stroke survivors who were severely disabled and/or lacked mental capacity were invited to fill and return
12 the caregivers' questionnaires only on behalf of patients. The information sheets stated that consent was
13 implied by returning the completed questionnaire. Participants were asked to return completed questionnaires
14 to the research centre in the FREEPOST envelopes provided. A second mail out of the study invitation pack
15 was sent to all patients as a reminder, 2 weeks after the first one.

38

39 **Survey Analysis**

40
41 Survey data entry was performed by Document Capture Company.²⁹ Individual patients' characteristics (age,
42 gender, time since stroke, number of daily medicines) were collected from the questionnaires themselves.
43
44 Practice population, number of patients on stroke registers, deprivation score and ethnicity were taken from the
45 National General Practice profiles (<https://fingertips.phe.org.uk/profile/general-practice>). The proportions of
46 patients in each sociodemographic category, needing help taking medication, missing any medication in the
47 previous 30 days, and reporting the need for more help taking medication, were estimated. When the survivor
48 and caregiver questionnaires were both returned together, study data were collected from the patient's
49 questionnaire only.

1
2
3 Multivariable logistic regression analysis was fitted to estimate associations between ‘Unmet needs’
4 and the variables: age $<$ or ≥ 70 years, gender, total number of medicines taken, dependence for ADL, years
5 since stroke, and receiving help with medicines. In the model each domain of help with medicine was
6 estimated individually and then combined. A second multivariable logistic regression examined the
7 association between ‘Missed medicines in the previous 30 days’ and the variables: age $<$ or > 70 years, gender,
8 total number of medicines taken, dependent for ADL, years since stroke, help with medicines and unmet
9 needs. Regression models were adjusted for age, gender and variable of interest. All statistical analysis have
10 been conducted with Stata (version 14, StataCorp LP, College Station, TX, USA, 2013).

21 Results

22 Questionnaire development

23
24
25
26 Taking medications emerged as an important issue in all three workshops: nearly half of patients
27 stated that a family member or friend was supporting them with daily medicine routines especially in relation
28 to prompting medicine taking. This was put down to effects of the stroke itself on memory retention rather
29 than general memory problems that people without stroke also experience. They admitted missing doses due to
30 forgetting. Only a small proportion of survivors were actually handling their own prescriptions and were
31 relying on support from family and/or community services. In one workshop almost all survivors had Dosette
32 medication boxes and agreed that taking medications out of safety bottles and blister packs was a problem due
33 to physical disabilities.
34
35
36
37
38
39
40
41
42

43 Thematic analysis of workshop data revealed five main practical domains of support needed with
44 medication taking: 1) Dealing with prescriptions and collection of medicines; 2) Getting medicines out of the
45 box, blister packs or bottles; 3) Prompting ‘It’s time to take your medicine’; 4) Swallowing medicines; and 5)
46 Checking whether medicines have been taken. The final study questionnaire (see Supplementary file 1)
47 included questions relating to each of these five domains, one item related to adherence (missed medicine in
48 the last 30 days) and an assessment of disabilities through completion of the validated postal version of the
49 Barthel Index.²⁷ The questionnaire was adapted for caregivers (see Supplementary file 2).

53
54
55
56
57
58
59
60

Questionnaire finalisation

On the basis of the fourth workshop and two 'think-aloud' interviews, we reworded the survey questions (e.g. from 'Do you get help with' was changed into 'Is somebody helping you with') and used a scale response 'All the time', 'Often', 'Sometimes', 'Rarely', 'Never' for the first question of each of the five survey domains, which was originally conceived as a 'yes' or 'no' answer (see table 2 for text of questions).

Survey

Practice characteristics

18 GP practices agreed to take part in the study, of which just over 1/3 were in London (n=7). GP practices were relatively large with an average population of 11,904 patients (SD = 4010) and a low to moderate level of deprivation (Index of Multiple Deprivation³⁰ (IMD): Mean-7.05: SD-3.19). Out of 3066 patients on the stroke registers, 1687 stroke patients (55%) were considered eligible for the study and received the postal questionnaire. The average response rate of East of England and London practices was 42% and 27% respectively. The response rate varied between 16% and 53% across practices.

Participant characteristics

596 participants returned a completed questionnaire [549 (92.4%) from patients, 45 (7.6%) from caregivers] showing a mean response rate of 35% (0.33-0.37). Participants were on average 72.7yrs old. 37.8% (n=210) of the sample were female and 62.2% male (n=346), see table 1. The mean number of years since stroke was 7.7 and participants took an average of 6 different medicines a day. There were a high proportion of white patients in the recruited practices which were on average 21% of mixed or ethnic minority background. Approximately 23% of study participants were completely independent for ADL.

Participants getting any kind of help with medicines were on average 73.6 years old, two thirds were male, had a stroke approximately 8 years previously and were taking on average 1 extra medication a day. Only 19% of this group were completely independent for ADL, see second part of table 1.

Table 1 here

Support with daily medication taking

Table 2 shows the mean responses to the survey questions quantifying the help participants receive with medicines and unmet needs. Overall, 55.7% (95% CI: 51.7-59.7) of the participants received help in at least one aspect of taking medication, in that they ticked one of the options from 'all the time' to 'rarely' on one or more of the five questions related to medicine taking. 11.4% (95% CI: 8.8-13.9) of patients reported experiencing unmet needs and needing more help with at least one of the aspects of taking medication, in that they ticked 'yes' to the question "do you feel you need more help", on one or more of the five questions related to medicine taking.

Among participants help was needed to some degree with prescriptions and collection of medicines (49.7%), getting medicines out of the box or packet (27.9%), reminding to take medicines (36.4%), swallowing medicines (20.2%) and checking that medicines have been taken (34.2%). Being reminded to take medicines, dealing with prescriptions and collection of medicines and getting medicines out of a pack or bottle were the most commonly reported areas of unmet needs. Almost two thirds of participants (65.3%) reported never missing medicines in the last 30 days. Out of the 34.7% of patients who said they missed taking medicine at any point in the previous 30 days, 23.9% said rarely, 9.3% sometimes, 0.8% often and 0.7% all the time.

Table 2 here

Factors associated with unmet needs

Being on a higher total number of daily medications (OR: 1.2, (1.1-1.3), $p < 0.001$), dependent for ADL (OR: 4.9, (1.9-13.0), $p = 0.001$) and receiving any kind of help (OR: 5.6, (2.7-11.63), $p < 0.001$) in relation to taking medication was associated with experiencing unmet needs. Getting help with swallowing medicines (OR: 6.8, (3.8-12.02), $p < 0.001$), getting medicines out of a box, blister packs or bottles (OR: 6.5,

(3.6-11.8), $p<0.001$) showed the strongest associations with experiencing unmet needs. However age, gender, and number of years since stroke showed no significant association with unmet needs (see table 3).

Table 3 here

Factors associated with missing medications

Being older (age ≥ 70) was associated with a lower probability of missing medication (OR: 0.59 (0.41-0.86) $p=0.006$). Being on a higher number of daily medicines (polypharmacy) (OR:1.07 (1.02-1.12), $p=0.008$) and getting any kind of help with medicine taking (OR:2.08 (1.43-3.03) $p<0.001$) was associated with higher probability of missing medicines. The more unmet needs stroke survivors had with taking medication, the more likely they were to miss their medicines (OR:5.3 (2.9-9.5), $p<0.001$). Gender, dependence for ADL's and number of years since stroke showed no significant association with missing medicines (see table 4).

Table 4 here

Discussion

Summary of findings

From workshops we identified 5 key issues that patients regarded as important with medication taking after stroke. We converted these into a five item questionnaire that we distributed to people on stroke registers in 18 general practices. We obtained a response rate of 35%. Among respondents, 56% of survivors in the community were receiving help in some aspect of daily medication taking, 11% reported needing more help in at least one domain of medicine taking and 33% missed taking their medicines at some point in the previous 30 days.

1
2
3 A higher total number of daily medicines, being dependent for ADLs and receiving help with
4 medication were predictors of experiencing at least one unmet need in respect of medication taking. Stroke
5 survivors who were younger, taking a higher number of daily medicines and experiencing a greater number of
6 unmet needs were more likely to miss medications.
7
8

9
10 This work identified issues from a population that includes patients severely affected by stroke, who are often
11 excluded from research.¹⁷ Results presented here shed light on the effect of stroke related impairments on
12 practical domains and predictors of medicine taking, which are shown to have significant effects on overall
13 adherence.
14
15
16
17

18 19 20 **Strengths and limitations**

21
22 A strength of this study is that the questionnaire was developed from patients' and caregivers' own
23 views gathered through workshops. Although not recruited through purposive sampling, workshop participants
24 suffered from a range of stroke related impairments, as highlighted by the reported use of Dossette boxes,
25 dependence on others for aspects of medicine taking like prompting medication times, and dependence for
26 ADL's such as collecting prescriptions and taking tablets out of boxes. In the actual postal survey, the
27 inclusion of stroke survivors regardless of level of dependence for ADL's permitted investigating a population
28 who are understudied,¹⁷ yet may have significant unmet needs that can affect their adherence to medications.
29
30 This investigation highlights caregivers' role in managing medicines in survivors dependent for ADLs.
31
32
33
34
35
36
37

38 However, study limitations should also be considered. The response rate across recruited GP practices
39 was low and harder to reach stroke survivors may have been missed. This is a source of bias that might affect
40 our estimates. Through the Barthel score, we did not assess cognition directly, although low cognitive function
41 is associated with poor adherence.³¹ We did not collect information on the use of blister packaged medication
42 or devices to aid compliance, which could have influenced medication taking practices. Finally this study
43 examined all medicine taking and did not differentiate between stroke secondary prevention medications and
44 other drug categories.
45
46
47
48
49
50
51
52
53

54 **Comparisons with existing research**

1
2
3 To our knowledge this is the first study that shows that more than half of all stroke survivors get help
4 with some aspect of medicine taking and that those receiving help are more likely to have unmet needs. This
5 provides some insight in to why adherence to medication in stroke survivors may be poor.³²
6
7

8
9 Moreover, the greater the number of medicines, the more likely stroke survivors were to miss
10 medications. Addressing pill burden by simplifying drug regimens may be an important focus for future
11 interventions. Indeed the polypill approach to medication taking has been shown to reduce cardiovascular as
12 well as total pill burden in a primary care setting.³³ Simpler dosing regimens, are known to be associated with
13 better medication adherence³⁴ while fewer medicines has been shown to be an independent predictor of long
14 term medication persistence among stroke survivors.^{35 36} A recent trial incorporating a fixed-dose combination
15 polypill approach to taking cardiovascular medicine demonstrated better adherence among patients receiving a
16 single pill.³⁷
17
18
19
20
21
22
23

24 Receiving help with prescriptions and collecting medicines was identified as the area where most help
25 was received (49.7% of respondents). Stroke survivors who are dependent for activities of daily living may
26 face considerable practical challenges accessing health care resources at the pharmacy and the GP practice. A
27 recent study in the USA found that around 2/3 of caregivers were involved in at least 1 medication
28 management activity of elderly patients and that high involvement in Instrumental Activities of Daily Living
29 (IADLs) was associated with the caregiver providing the patient with assistance in ordering medicines.³⁸
30 Filling prescriptions is also known to be an important factor influencing medication adherence.^{39 40} Indeed
31 caregivers can play a significant role in ensuring appropriate medication taking. A recent interview study
32 exploring potential barriers and facilitators of medication adherence in stroke identified the central role of the
33 caregiver in medication adherence.⁴¹ Our evaluation of an online stroke forum also confirmed the important
34 role of the caregiver in facilitating medication adherence.¹⁴ Monitoring prescription collections, liaising with
35 the GP and pharmacy, increasing the time between prescriptions or arranging medication deliveries, may help
36 to address prescription needs.
37
38
39
40
41
42
43
44
45
46
47
48
49

50 Around 11% of stroke survivors reported unmet medication needs. We found that stroke survivors
51 dependent for ADLs and receiving help with medicines were more likely to report unmet needs, which is in
52 line with a recent study investigating stroke/TIA survivors in Australia, where greater functional ability was
53 associated with fewer unmet needs, including those related to secondary prevention.⁴² In previous research on
54
55
56
57
58
59
60

1
2
3 unmet needs among stroke survivors, a 44 item survey study by McKevitt and colleagues (2011) reported that
4 49% of stroke survivors had at least one unmet need²⁴, while in a study of Australian survivors who
5 completed a 58 item survey, the percentage was 84%.²³ Both these studies however examined unmet needs
6 over a variety of domains including health, work, leisure and everyday living, social support and finances,
7 whereas our study focused on medication needs only.
8
9
10
11

12 Getting help to take medicines out of a box, packet or bottle was the area where the greatest proportion
13 of stroke survivors needed help all of the time. We previously found that the use of pill boxes and blister
14 packed medication to be both a facilitator³⁵ and a barrier¹⁴ to adherence among stroke survivors¹⁵, while
15 interventions using blister packaging and pill boxes have been found to be associated with improved
16 adherence.⁴³ Although electronic medication devices were considered potentially effective in improving
17 medication taking behaviour among patients with cognitive impairments, success in using such devices was
18 dependent on the patient having a good level of dexterity, while removing the medication from these devices
19 was also found to be challenging.^{44 45 46}
20
21
22
23
24
25
26
27

28 The need for further support in this domain, as reported in the current study, suggests that handling
29 medications remains problematic for stroke survivors.
30
31

32 An interesting finding from this survey study is that stroke survivors who missed medicines were
33 younger. This is consistent with other research on adherence in stroke that found that younger age was
34 predictive of poor adherence⁴⁷, and has also been described in patients taking medication for cardiovascular
35 disease.⁴⁸ The finding in the present study contrasts with the view that older patients are more likely to face
36 difficulties taking medication^{49 50} which is frequently attributed to higher number of pre-existing comorbidities
37 resulting in polypharmacy and increased complexity of medication taking regimens. The fact that older
38 patients may be less likely miss medicine might be down to the support they receive from caregivers. Our
39 findings suggests that support needed with medications may be overlooked in younger stroke survivors.⁵¹
40
41
42
43
44
45
46
47

48 In this study a significant proportion of patients admitted missing medications occasionally. There is
49 evidence that improving adherence by one anti-hypertensive pill/week for a once-a-day regimen reduces the
50 hazard of stroke by 8–9 % and death by 7 %.⁵² Each incremental 25% increase in proportion of days covered
51 with statin medications is associated with a 0.10 mmol/L reduction in LDL-C cholesterol.^{53 54} Non-adherence
52 to cardiovascular medications is associated with increased risk of morbidity and mortality.⁵⁵

Implications for clinical practice

A significant proportion of patients, particularly those who take large numbers of tablets, are disabled or receive help to take medication, have unmet needs and miss their tablets, which can increase risk of recurrent cardiovascular events. These particularly vulnerable groups of patients might benefit from focused clinical attention. Through understanding the needs of survivors and caregivers in different aspects of daily medication taking, we can help direct future resources to the areas of greatest need. For example, further exploration of medication packaging is warranted to understand the difficulties stroke survivors face handling medicines. Polypharmacy remains a difficulty for older patients. Therefore, exploring the use of combination pills and further efforts to reduce the burden of multiple medications among stroke survivors is warranted.

The questionnaire we have developed could be used to understand the challenges around medication faced by other patient groups. Unmet medication needs among UK stroke survivors have not been previously explored in the context of activities both survivors and caregivers consider important for taking medicines. Through understanding the extent of unmet needs as well as the areas in which these are greatest, strategies can be developed which address poor medication taking practices and therefore improve medication adherence.

Future research

Novel interventions focussing on the practicalities of taking medicines and aimed at improving stroke survivors' adherence to treatment are needed. The findings reported here may inform the development of such interventions. Advances in technology have the potential to facilitate delivery of such interventions, e.g. electronic devices prompting medication taking times.^{56 57} Efforts to improve medication taking among survivors of stroke using technology are already underway and have shown promise.⁵⁸

Acknowledgements

The authors wish to thank all the stroke survivors and caregivers who participated in this study.

Question 4 Is somebody helping you with swallowing your medicine?	579	56 (9.7)	11 (1.9)	29 (5.0)	21 (3.6)	462 (79.8)		
Question 4a Do you feel you need more help with swallowing your medicine?							9 (1.6)	551 (98.4)
Question 5 Is somebody helping you with checking that you have taken your medicines?	576	76 (13.2)	23 (4.0)	58 (10.0)	40 (6.9)	379 (65.9)		
Question 5 a Do you feel you need more help with checking that you have taken your medicine?							20 (3.6)	538 (96.4)
Thinking of the last 30 days, how often did you miss taking your regular medicines?	594	4 (0.7)	5 (0.8)	55 (9.3)	142 (23.9)	388 (65.3)		

Table 2. Responses to the survey questions.

	Univariable analysis	Multivariable analysis
Variable	Odds ratio (95% CI) p value	Odds ratio (95% CI) p value
Age ≥ 70	0.63 (0.37-1.06) p=0.084	0.69 (0.40-1.19) p=0.180
Gender (female)	0.65 (0.36-1.15) p=0.137	0.65 (0.36-1.17) p=0.147
Number of different medicines	1.20 (1.12-1.28) p<0.001	1.22 (1.14-1.31) p<0.001
Dependence for ADLs	4.10 (1.59-10.56) p=0.003	4.91 (1.86-12.97) p=0.001
Years since stroke	1.03 (1.00-1.06) p=0.078	1.02 (0.99-1.05) p=0.160
Getting help with prescriptions and collection of medication	4.67 (2.48-8.79) p<0.001	4.55 (2.38-8.67) p<0.001
Getting help with taking medicines out of the box, bottle or blister pack	6.70 (3.81-11.77) p<0.001	6.53 (3.63-11.75) p<0.001
Getting help with reminding you when is the time to take your medicine?	4.70 (2.68-8.21) p<0.001	4.25 (2.39-7.56) p<0.001
Getting help to swallow the medication	6.72 (3.89-11.59) p<0.001	6.75 (3.79-12.02) p<0.001
Getting help by checking that you have taken your medicines	4.89 (2.81-8.52) p<0.001	5.58 (3.08-10.09) p<0.001
Getting any kind of help	5.86 (2.84-12.08) p<0.001	5.58 (2.68-11.63) p<0.001

Table 3. Variables associated with unmet needs.

	Univariable analysis	Multivariable analysis
Variable	Odds Ratio (95% CI) p value	Odds Ratio (95% CI) p value
Age ≥ 70	0.59 (0.42-0.84) p=0.003	0.59 (0.41-0.86) p=0.006
Gender (female)	0.86 (0.59-1.23) p=0.401	0.88 (0.61-1.28) p=0.498
Number of different medicines	1.04 (1.00-1.09) p=0.040	1.07 (1.02-1.12) p=0.008
Dependence for ADLs (BI<20)	1.21 (0.80-1.84) p=0.362	1.30 (0.83-2.04) p=0.248
Years since stroke	1.00 (0.98-1.02) p=0.950	1.00 (0.98-1.02) p=0.971
Getting help with prescriptions and collection of medication	2.04 (1.45-2.90) p<0.001	2.29 (1.58-3.32) p<0.001
Getting help to have the medicines out of the box, bottle or blister pack	1.39 (0.95-2.02) p=0.089	1.49 (1.00-2.21) p=0.051
Getting help with reminding you when is the time to take your medicine?	2.48 (1.74-3.55) p<0.001	2.67 (1.83-3.90) p<0.001
Getting help to swallow the medication	1.53 (1.01-2.32) p=0.045	1.68 (1.08-2.61) p=0.022
Getting help by checking that you have taken your medicines	2.37 (1.66-3.39) p<0.001	2.50 (1.70-3.66) p<0.001
Getting any kind of help	2.06 (1.44-2.93) p<0.001	2.08 (1.43-3.03) p<0.001
Unmet needs (participant reported more help needed)	5.27 (3.02-9.22) p<0.000	5.09 (2.84-9.11) p<0.001

Table 4. Variables associated with missing medicines.

QUESTIONNAIRE – PATIENT

Many people with stroke need help with taking their medicines. We would like to ask you few questions about the help you might need with taking your medicines.

How many different type of medicines do you take in one day?

Write the number or an approximation. Please count all medications including eye drops, injections etc.

How old are you?

How long ago was your stroke? years

What is your sex?

 M

 F

For each question below, please tick the box that best describes how you have taken your medicines in the last month:

1. Is somebody helping with prescriptions and collection of your medicines?

all the time
often
sometimes
rarely
never

Do you feel you need more help with prescriptions and collection of your medicines?

Yes

No

2. Is somebody helping you getting the medicines out of the box, bottle or blister pack?

all the time
often
sometimes
rarely
never

Do you feel you need more help with getting the medicines out of the box, bottle or blister pack?

Yes

No

3. Is somebody helping with reminding you when is the time to take your medicine?

all the time
often
sometimes
rarely
never

Do you feel you need more help with reminding when is the time to take your medicine?

Yes No

4. Is somebody helping you with swallowing your medicine? For example by giving you a drink

all the time
often
sometimes
rarely
never

Do you feel you need more help with swallowing your medicine?

Yes No

5. Is somebody helping you with checking that you have taken your medicines?

all the time
often
sometimes
rarely
never

Do you feel you need more help with checking that you have taken your medicine?

Yes No

Missing medicines

Thinking of the last 30 days, how often did you miss taking your regular medicines?

all the time
often
sometimes
rarely
never

Remember - tick one box only

Barthel Questionnaire

These are some questions about your ability to look after yourself.

They may not seem to apply to you.

Please answer them all.

Tick one box in each section.

Bathing

In the bath or shower do you:

manage on your own?

need help getting in and out?

Remember - tick one box only

need other help?

never have a bath or shower?

need to be washed in bed?

Stairs

Do you climb stairs at home:

without any help?

with someone carrying your frame?

Remember - tick one box only

with someone encouraging you?

with physical help?

not at all?

don't have stairs?

Dressing

Do you get dressed:

without any help?

just with help with buttons?

Remember - tick one box only

with someone helping you most of the time?

Mobility

Do you walk indoors:

without any help apart from a frame?

with one person watching over you?

Remember - tick one box only

with one person helping you?

with more than one person helping?

not at all?

Or do you use a wheelchair independently?
(e.g. round corners)

Transfer

Do you move from bed to chair:

on your own?

with a little help from one person?

Remember - tick one box only

with a lot of help from one or more people?

not at all?

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
--------------------------	--------------------------	--------------------------	--------------------------	--------------------------

Feeding

Do you eat food:	without any help?	<input type="checkbox"/>
	with help cutting food or spreading butter?	<input type="checkbox"/>
<i>Remember - tick one box only</i>	with more help?	<input type="checkbox"/>

Toilet use

Do you use a toilet or commode:	without any help?	<input type="checkbox"/>
	with some help but can do something?	<input type="checkbox"/>
<i>Remember - tick one box only</i>	with quite a lot of help?	<input type="checkbox"/>

Grooming

Do you brush your hair and teeth	without help?	<input type="checkbox"/>
Wash your face and shave:	with help?	<input type="checkbox"/>
<i>Remember - tick one box only</i>		

Bladder

Are you incontinent of urine?	never	<input type="checkbox"/>
	less than once a week	<input type="checkbox"/>
<i>Remember - tick one box only</i>	less than once a day	<input type="checkbox"/>
	more often	<input type="checkbox"/>
	Or do you have a catheter managed for you	<input type="checkbox"/>

Bowels

Do you soil yourself?	never	<input type="checkbox"/>
	Occasional accident	<input type="checkbox"/>
<i>Remember - tick one box only</i>	all the time	<input type="checkbox"/>
	or do you need someone to give you an enema?	<input type="checkbox"/>

Help with taking tablets after stroke

FAMILY MEMBER/FRIEND OR PRIVATE CARER COPY

Many people with stroke need help with taking their medicines. We would like to ask you few questions about the help you might be offering to your family member/friend/ patient with stroke with taking medicines.

Relation with your family member/friend with stroke

Are you:

- partner
- son or daughter
- friend
- carer from an agency
- other
- if other, please specify

Remember - tick one box only

How many different types of medicines does your family member/friend/patient with stroke take in one day?
Write the number or an approximation. Please count all medications including eye drops, injections etc.

How old is your family member/friend/patient with stroke? (years)

How many years ago was your family member/friend/patient's stroke?

What is your family member/friend/patient with stroke sex?

M F

For each question below, please tick the box that best describes the help needed by your family member/friend/patient with stroke with taking medicines in the last month.

1. Is somebody helping your family member/friend/patient with stroke with prescriptions and collection of his/her medicines?

- all the time
- often
- sometimes
- rarely
- never

Do you feel your family member/friend/patient with stroke needs more help with prescriptions and collection of his/her medicines?

Yes

No

.

2. Is somebody helping your family member/friend/patient with stroke getting the medicines out of the box, bottle or blister pack?

all the time
often
sometimes
rarely
never

Do you feel your family member/friend/patient with stroke needs more help with getting the medicines out of the box, bottle, or blister pack?

Yes No

3. Is somebody helping your family member/friend/patient with stroke with reminding when is time to take his/her medicine?

all the time
often
sometimes
rarely
never

Do you feel your family member/friend/patient with stroke needs more help with reminding when is time to take his/her medicine?

Yes No

4. Is somebody helping your family member/friend/patient with stroke with swallowing his/her medicine? For example by giving a drink.

all the time
often
sometimes
rarely
never

Do you feel you your family member/friend/patient with stroke need more help with swallowing his/her medicine?

Yes No

5. Is somebody helping your family member/friend/patient with stroke with checking that he/she has taken his/her medicines?

all the time
often
sometimes
rarely
never

Do you feel your family member/friend/patient with stroke needs more help with checking that he/she has taken his/her medicine?

Yes No

Missing medicines

Thinking of the last 30 days, how often did your family member/friend/patient with stroke miss taking his/her regular medicines?

- all the time
- often
- sometimes
- rarely
- never

Remember - tick one box only

Barthel Questionnaire

These are some questions about the ability of your family member/friend/patient with stroke to look after him/herself.

Please answer them all.

Please fill this questionnaire even if you are not regularly caring for your family member/friend/patient with stroke, trying to answer questions in the way you think most accurately describes the disability of your family member/friend/patient with stroke.

Tick one box in each section.

Bathing

In the bath or shower do you:

- manage on your own?
- need help getting in and out?
- need other help?
- never have a bath or shower?
- need to be washed in bed?

Remember - tick one box only

Stairs

Do you climb stairs at home:

- without any help?
- with someone carrying your frame?
- with someone encouraging you?
- with physical help?

STROBE 2007 (v4) Statement—Checklist of items that should be included in reports of *cross-sectional studies*

Section/Topic	Item #	Recommendation	Reported on page #
Title and abstract	1	(a) Indicate the study’s design with a commonly used term in the title or the abstract	2
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	4-5
Objectives	3	State specific objectives, including any prespecified hypotheses	5
Methods			
Study design	4	Present key elements of study design early in the paper	6
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	6
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants	7-8
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	8
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	6-7
Bias	9	Describe any efforts to address potential sources of bias	-
Study size	10	Explain how the study size was arrived at	10
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	8-9
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	8-9
		(b) Describe any methods used to examine subgroups and interactions	8-9
		(c) Explain how missing data were addressed	-
		(d) If applicable, describe analytical methods taking account of sampling strategy	-
		(e) Describe any sensitivity analyses	-

Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	10
		(b) Give reasons for non-participation at each stage	-
		(c) Consider use of a flow diagram	-
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	10-11
		(b) Indicate number of participants with missing data for each variable of interest	-
Outcome data	15*	Report numbers of outcome events or summary measures	
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	11-12
		(b) Report category boundaries when continuous variables were categorized	-
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	-
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	-
Discussion			
Key results	18	Summarise key results with reference to study objectives	13
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	13-14
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	14-16
Generalisability	21	Discuss the generalisability (external validity) of the study results	17
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	3

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.

Abstract

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60

1 2

Objectives

To design a questionnaire and use it to explore unmet needs with practical aspects of medicines taking after stroke, predictors of medicine taking and to estimate the proportion of survivors who get support with daily medication taking.

6 7

Design

Four workshops with stroke survivors and caregivers to design the questionnaire.

A cross-sectional postal questionnaire in primary care.

9 10

Setting

18 GP practices in the East of England and London. Questionnaires posted between September 2016 and February 2017.

12 13

Participants

1687 stroke survivors living in the community outside institutional long term care.

14 15

Primary Outcome measures

The proportion of community stroke survivors receiving support from caregivers for practical aspects of medicine taking; the proportion with unmet needs in this respect; the predictors of experiencing unmet needs and missing taking medications.

18 19

Results

A 5-item questionnaire was developed to cover the different aspects of medicine taking. 596/1687 (35%) questionnaires were returned. 56% reported getting help in at least one aspect of taking medication and 11% needing more help. 33% reported missing taking their medicines. Unmet needs were associated with receiving help with medications (OR: 5.6, $p<0.001$), being on a higher number of medications (OR: 1.2, $p<0.001$) and being dependent for activities of daily living (ADLs) (OR: 4.9, $p=0.001$). Missing medication was associated with having unmet needs (OR: 5.1, $p<0.001$), receiving help with medications (OR: 2.1, $p<0.001$), being on a higher number of medicines (OR: 1.1, $p=0.008$) and being older than 70 years (OR: 0.6, $p=0.006$).

1 **Conclusions**

2 More than half of patients who replied needed help with taking medication, and 1 in 10 had unmet needs in
3 this regard. Stroke survivors dependent on others have more unmet needs, more likely to miss medicines and
4 might benefit from focused clinical and research attention. Novel primary care interventions focusing on the
5 practicalities of taking medicines are warranted.

9 10 Article summary

11 Strengths and Limitations

- 12 • Development of the questionnaire was based on patients' and caregivers' own views gathered through
13 workshops.
- 14 • Stroke survivors were recruited from two UK regions.
- 15 • This work identified issues from a population that includes patients severely affected by stroke, who
16 are often excluded from research.
- 17 • Results shed light on the effect of stroke related impairments on practical domains and predictors of
18 medicine taking, which have significant effects on medication adherence and call for new primary care
19 interventions.
- 20 • The low response rate reported is a limitation of this study and stroke survivors who are harder to
21 reach may have been missed.

22
23 Funding: This study was funded by the RCGP SFB, Ref. SFB 2014 – 15 'Quantifying the support stroke
24 survivors get with daily medication taking: a questionnaire survey'. Anna De Simoni and Luis Ayerbe are
25 funded by a NIHR Academic Clinical Lectureships. This article therefore presents independent research
26 funded by NIHR. The views expressed are those of the authors and not necessarily those of the NHS, the
27 NIHR, or the Department of Health. James Jamison was supported by a research grant from The Stroke
28 Association and the British Heart Foundation: TSA BHF 2011/01

6

7

8 Introduction

9

10
11
12
13 6 Stroke is the leading cause of disability in developed countries, with an estimated that 25-74% of the
14
15 7 50 million stroke survivors worldwide requiring some assistance or being fully dependent on caregivers for
16
17 8 activities of daily living (ADLs).¹⁻³ For many older adults remaining independent at home may depend on how
18
19 9 well they can manage complex medication regimens.^{4,5} Around half of stroke survivors are dependent on
20
21 10 others for everyday activities.⁶

22
23 11 There is evidence that being dependent for ADLs and impairment in mobility and communication
24
25 12 decrease medication adherence in patients suffering from hypertension.⁷ Deficits in attention, cognition or
26
27 13 working memory have been linked with non-adherence to medications in other patient groups.⁸ In a recent
28
29 14 systematic review of medication adherence among patients with cognitive impairment, one third of studies
30
31 15 showed that such patients were likely to have a caregiver to assist with medications and there was an
32
33 16 association between taking four or more medicines and nonadherence.⁹ In patients taking cardiovascular
34
35 17 medicines, multiple factors including cognitive problems, lack of social support, dosing regimen, as well as
36
37 18 practical problems and difficulties accessing services, contribute to poor medication adherence.^{10,11} Low
38
39 19 adherence to secondary prevention medication is associated with poor cardiovascular health.^{12,13}

40
41 20 Stroke survivors have previously reported difficulties in the handling of medication as a barrier to
42
43 21 adherence to secondary prevention medication after stroke.¹⁴ This was true irrespective of age at stroke, with
44
45 22 younger and older stroke survivors being similarly affected.¹⁴ Research on medication adherence in stroke has
46
47 23 identified multiple barriers to medication taking among stroke survivors.¹⁴⁻¹⁶ However interventions developed
48
49 24 to improve adherence have mainly concentrated on patients responsible for their own medicine taking.^{17,18}

50
51 25 In England, the average age at stroke is 74 for men and 80 years for women.¹⁹ In elderly patients in
52
53 26 particular, cognitive deficits, taking large number of medicines and the complexity of medication regimens
54
55 27 have been identified as barriers to medication adherence.^{20,21} Caregivers are known to play a key role in

1
2
3 1 providing assistance to older people in a range of daily activities including medication taking and physician
4 visits,²² and can help improve adherence in cardiac patients with memory problems.²³

5
6
7 3
8
9 4
10
11 5 Survivors of stroke have previously reported unmet needs including physical difficulties, cognitive
12 and emotional difficulties, information needs and other unmet needs.^{24 25} However we know little about factors
13 that influence medication taking among stroke survivors with disabilities (i.e. physical or cognitive) living in
14 the community (i.e. not in nursing homes), their unmet needs around the use of medicines or the proportion
15 relying on caregivers for some or all aspects of medicine taking.

16
17
18
19
20
21 10 To date, survey instruments examining the unmet needs of stroke survivors have not focused on practical
22 aspects of medication taking such as how patients collect or handle their medicines.

23
24
25 12 The aims of this investigation were to design an instrument to evaluate the support stroke survivors get
26 with taking their medicines, characterise patients receiving help with medications, estimate the proportion who
27 have unmet needs with daily medicine taking and who miss medications. We additionally aimed to identify the
28 predictors of missing medicines and of experiencing unmet needs with medications.

29
30
31 15 This knowledge can inform the development of primary care interventions aimed at improving medication
32 taking in this patients' group.

33 34 35 36 18 Methods

37 38 39 40 41 20 **Questionnaire development workshops**

42
43 21 To develop the questionnaire, current literature evidence was evaluated¹⁷ and three workshops were
44 conducted with 26 stroke survivors and 12 caregivers in the East of England (St John's College, Cambridge
45 2009²⁶: 7 patients, 1 caregiver; Different Strokes, Cambridge 2012: 9 patients, 3 caregivers; Peterborough,
46 2012: 10 patients, 8 caregivers). Recruitment was opportunistic and no purposive sampling was applied. The
47 workshops were organised in the context of gathering Patient and Public Involvement (PPI) input into research
48 grant applications aimed at improving adherence to medication after stroke.¹⁷

49
50
51
52
53 26 The survey questions were developed through thematic analysis²⁷ of workshops field notes.

1
2
3 1 A fourth workshop was conducted to gather feedback on the questionnaire using a PPI (Patient and
4
5 2 Public Involvement) exercise with 11 stroke survivors and 3 caregivers recruited through a local stroke group
6
7 3 (Different Strokes, East of England). Two stroke survivors from this group took part in subsequent 'think-
8
9 4 aloud' interviews, which involved talking out loud as they read the questionnaire, continually verbalising what
10
11 5 they were thinking.

12 6 **Postal survey**

13
14 7 In respect to sample size, 400 returned questionnaires would allow good precision for prevalence estimates.

15
16 8 The 95% confidence intervals on various proportions with this sample size were calculated using the Wilson
17
18 9 score method (with continuity correction) and are as follows: 50% (45.00-55.00%), 25% (20.89%-29.60%),
19
20 10 5% (3.16-7.74%). With 600 questionnaires, the improvement in the precision of the estimates would be as
21
22 11 follows: 45.93%-54.07%, 21.62-28.70% and 3.46%-7.14% respectively.

23
24 12 General practices in primary care in the East of England and London were approached through the Clinical
25
26 13 Research Network (CRN). CRN Eastern contacted 20 GP practices, of which 11 replied and took part in the
27
28 14 study. CRN North London contacted 140 GP East London practices by email (Tower Hamlets, Newham and
29
30 15 City & Hackney CCGs), of which only two replied and participated in the study. Five of the eight GP practices
31
32 16 contacted in North London (Barnet CCG) through a research coordinator took part in the study.

33
34 17 Patients with stroke and their caregivers were sent the postal questionnaire according to the following criteria
35
36 18

37 38 19 Inclusion Criteria

39
40 20 Patients:

41
42 21 All patients aged > 18 on the practice stroke register with documented history of stroke.

43
44
45 22 Caregivers:

- 46
47 23 • Anyone identified by the patient as having a role helping with medicine taking.

48 49 24 Exclusion Criteria

- 50
51 25 • Patients who suffered a Transient ischaemic attack (TIA) but not a stroke.
- 52
53 26 • Palliative or end of life patients.

- 1 • Patients receiving institutional long term care (receiving total care in residential homes or living in
- 2 nursing homes).
- 3 • Patients considered unsuitable to taking part in the study by their GP.

5 **Survey participant identification**

6 A list of prospective patients was compiled from the stroke register of each surgery by the practice
7 staff. No restriction was placed on the recruitment of survivors who were dependent for ADLs or lacking
8 capacity. The list was screened by a practice GP and anyone not meeting the inclusion criteria or who was
9 considered unsuitable for the study was excluded.

11 **Survey participant recruitment**

12 Eligible participants were sent a study survey pack by practice staff between September 2016 and
13 February 2017. Study recruitment packs included two invitation letters, information sheets, questionnaires and
14 postal version of Barthel Index²⁸, one of which was for completion by the patient and the other by the
15 caregiver. The Barthel Index provides a measure of functional independence and physical functioning and has
16 been used in stroke research previously.²⁹ Patients with Barthel score 20 were categorised as independent for
17 ADLs, those with score 15-19 moderately dependent for ADLs, and those with scores 0-14 severely
18 dependent.³⁰ If receiving help with medications, the patient was asked to pass to their caregiver the invitation
19 letter and information sheet and invite him/her to complete their copy of the questionnaire, providing answers
20 on the patient's medicine taking. Family members, friends or paid caregivers of stroke survivors who were
21 severely disabled and/or lacked mental capacity were invited to fill and return the caregivers' questionnaires
22 only on behalf of patients. The information sheets stated that consent was implied by returning the completed
23 questionnaire. Participants were asked to return completed questionnaires to the research centre in the
24 FREEPOST envelopes provided. A second mail out of the study invitation pack was sent to all patients as a
25 reminder, 2 weeks after the first one.

1 Ethical approval

2 This study has received ethical approval from Cambridge Central Research Ethics Committee (REC reference:
3 16/EE/0182) and from the Health Research Authority (IRAS project ID: 170931)

5 Survey Analysis

6 Survey data entry was performed by Document Capture Company.³¹ Individual patients' characteristics (age,
7 gender, time since stroke, number of daily medicines) were collected from the questionnaires themselves.

8 Practice population, number of patients on stroke registers, deprivation score and ethnicity were taken from the
9 National General Practice profiles (<https://fingertips.phe.org.uk/profile/general-practice>). The proportions of
10 patients in each sociodemographic category, needing help taking medication, missing any medication in the
11 previous 30 days, and reporting the need for more help taking medication, were estimated. When the survivor
12 and caregiver questionnaires were both returned together, study data were collected from the patient's
13 questionnaire only. The associations between 'Unmet needs' and age (< or ≥70 years), gender, total number
14 of medicines taken, dependence for ADLs, years since stroke, and receiving help with medicines were
15 investigated with individual logistic regression models (a different model per variable investigated), adjusted
16 each and all of them for age and gender. Individual logistic regression models adjusted for age and gender
17 were also used to estimate the association between 'Missed medicines in the previous 30 days' and age (< or >
18 70 years), gender, total number of medicines taken, dependent for ADLs, years since stroke, help with
19 medicines and unmet needs (a different model adjusted for age and gender per variable investigated).

20 Sensitivity analysis was conducted to investigate if predictors of missing medication or unmet needs vary
21 when the analysis was done on the whole dataset *versus* on questionnaires filled by patients only.

22 Chi squared tests were used to compare the responses on unmet needs and missing medication given by
23 patients *versus* caregivers.

24 All statistical analysis has been conducted with Stata (version 14, StataCorp LP, College Station, TX, USA,
25 2013).

Results

2 Questionnaire development

3 Taking medications emerged as an important issue in all three workshops: nearly half of patients
4 stated that a family member or friend was supporting them with daily medicine routines especially in relation
5 to prompting medicine taking. This was put down to effects of the stroke itself on memory retention rather
6 than general memory problems that people without stroke also experience. They admitted missing doses due to
7 forgetting. Only a small proportion of survivors were actually handling their own prescriptions and were
8 relying on support from family and/or community services. In one workshop almost all survivors had Dosette
9 medication boxes and agreed that taking medications out of safety bottles and blister packs was a problem due
10 to physical disabilities.

11 Thematic analysis of workshop data revealed five main practical domains of support needed with
12 medication taking: 1) Dealing with prescriptions and collection of medicines; 2) Getting medicines out of the
13 box, blister packs or bottles; 3) Prompting 'It's time to take your medicine'; 4) Swallowing medicines; and 5)
14 Checking whether medicines have been taken. The final study questionnaire (see Supplementary file 1)
15 included questions relating to each of these five domains, one item related to adherence (missed medicine in
16 the last 30 days) and an assessment of disabilities through completion of the validated postal version of the
17 Barthel Index.²⁸ The questionnaire was adapted for caregivers (see Supplementary file 2).

18 Questionnaire finalisation

19 On the basis of the fourth workshop and two 'think-aloud' interviews, we reworded the survey
20 questions (e.g. from 'Do you get help with' was changed into 'Is somebody helping you with') and used a
21 scale response 'All the time', 'Often', 'Sometimes', 'Rarely', 'Never' for the first question of each of the five
22 survey domains, which was originally conceived as a 'yes' or 'no' answer (see supplementary file for text of
23 questions).

Survey

2 **Practice characteristics**

18 GP practices agreed to take part in the study, of which just over 1/3 were in London (n=7). GP practices were relatively large with an average population of 11,904 patients (SD = 4010) and a low to moderate level of deprivation (Index of Multiple Deprivation³² (IMD): Mean-7.05: SD-3.19). Out of 3066 patients on the stroke registers, 1687 stroke patients (55%) were considered eligible for the study and received the postal questionnaire. The average response rate of East of England and London practices was 42% and 27% respectively. The response rate varied between 16% and 53% across practices.

10 **Participant characteristics**

596 participants returned a completed questionnaire [549 (92.1 %) from patients, 47 (7.9 %) from caregivers showing a mean response rate of 35% (0.33-0.37). Participants were on average 72.7 yrs old. 37.8% (n=210) of the sample were female, see table 1. There were a high proportion of white patients in the recruited practices (79%), which were on average 21% of mixed or ethnic minority background. Approximately 28% of study participants were completely independent for ADLs.

Participants getting any kind of help with medicines were on average 73.6 years old, two thirds were male with only 19% of this group completely independent for ADLs.

Patients with unmet needs were on average 69 years old, predominantly male (71%) and 56.86% were severely dependent for ADLs. Patients who missed medications were on average 70 years old, 64% were male and the majority (48%) were moderately dependent for ADLs.

Table 1 here

1 Support with daily medication taking

2

3 Overall, 55.5% (95% CI: 51.7-59.7) of the participants received help in at least one aspect of taking
4 medication, in that they ticked one of the options from 'all the time' to 'rarely' on one or more of the five
5 questions related to medicine taking. 11% (95% CI: 8.8-13.9) of patients reported experiencing unmet needs
6 and needing more help with at least one of the aspects of taking medication, in that they ticked 'yes' to the
7 question "do you feel you need more help", on one or more of the five questions related to medicine taking.
8 The proportion of questionnaires reporting unmet needs filled in by caregivers, 19.6% (n=9), and by patients,
9 10.7% (n=57), had no significant difference (p=0.068).

10 Among participants help was needed to some degree with prescriptions and collection of medicines
11 (49.8 %), getting medicines out of the box or packet (27.9 %), reminding to take medicines (36.4 %),
12 swallowing medicines (20.2 %) and checking that medicines have been taken (34.1 %).(see Table 2). Being
13 reminded to take medicines, dealing with prescriptions and collection of medicines and getting medicines out
14 of a pack or bottle were the most commonly reported areas of unmet needs. Almost two thirds of participants
15 (65.3%) reported never missing medicines in the last 30 days. Out of the 34.7% of patients who said they
16 missed taking medicine at any point in the previous 30 days, 23.9% said rarely, 9.3% sometimes, 0.8% often
17 and 0.7% all the time. The proportion of questionnaires reporting missing medication at some point, filled in
18 by caregivers, 27.7% (n=13), and by patients 35.3% (n=193), had no significant difference (p=0.292).

19 Table 2 here

20 Factors associated with unmet needs

21 Being on a higher total number of daily medications (OR: 1.2, (1.1-1.3), p<0.001), severe
22 dependence for ADLs (OR: 11.62 (4.16-32.43) p<0.001) and receiving any kind of help (OR: 5.6, (2.7-11.63),
23 p<0.001) in relation to taking medication was associated with experiencing unmet needs. Getting help with
24 swallowing medicines (OR: 6.8, (3.8-12.02), p<0.001), getting medicines out of a box, blister packs or bottles
25 (OR: 6.5, (3.6-11.8), p<0.001) showed the strongest associations with experiencing unmet needs (see table 3).

1
2
3 1 When the analyses were conducted with data from questionnaires filled by patients only, the variables
4 significantly associated with unmet needs were the same, apart from years since stroke (Supplementary
5 2
6 Appendix 1).
7 3

8
9 4 Table 3 here
10
11 5
12
13 6
14 7

15 8 **Factors associated with missing medications**

16
17
18 9 Being older (age ≥ 70) was associated with a lower probability of missing medication (OR: 0.59
19
20 10 (0.41-0.86) $p=0.006$). Being on a higher number of daily medicines (polypharmacy) (OR:1.07 (1.02-1.12),
21
22 11 $p=0.008$) and getting any kind of help with medicine taking (OR:2.08 (1.43-3.03) $p<0.001$) was associated
23
24 12 with higher probability of missing medicines. The more unmet needs stroke survivors had with taking
25
26 13 medication, the more likely they were to miss their medicines (OR: 5.3 (3.0-9.5), $p<0.001$). (see Table 4).
27
28 14 When the analyses were conducted with data from questionnaires filled by patients only, the variables
29
30 15 significantly associated with missing medication were the same (Supplementary Appendix 1).

Discussion

21 **Summary of findings**

22 From workshops we identified 5 key issues that patients regarded as important with medication taking
23 after stroke. We converted these into a five item questionnaire that we distributed to people on stroke registers
24 in 18 general practices. We obtained a response rate of 35%. Among respondents, 56% of survivors in the
25 community were receiving help in some aspect of daily medication taking, 11% reported needing more help in

1
2
3 1 at least one domain of medicine taking and 34% missed taking their medicines at some point in the previous
4
5 2 30 days.

6
7 3 A higher total number of daily medicines, being severely dependent for ADLs and receiving help with
8
9 4 medication were predictors of experiencing at least one unmet need in respect of medication taking. Stroke
10
11 5 survivors who were younger, taking a higher number of daily medicines and experiencing a greater number of
12
13 6 unmet needs were more likely to miss medications.

14
15 7 This work identified issues from a population that includes patients severely affected by stroke, who are often
16
17 8 excluded from research.¹⁷ Results presented here shed light on the effect of stroke related impairments on
18
19 9 practical domains and predictors of medicine taking, which are shown to have significant effects on overall
20
21 10 adherence.

22
23 11

24
25 12

26 27 13 **Strengths and limitations**

28
29 14 A strength of this study is that the questionnaire was developed from patients' and caregivers' own
30
31 15 views gathered through workshops. Although not recruited through purposive sampling, workshop participants
32
33 16 suffered from a range of stroke related impairments, as highlighted by the reported use of Dossette boxes,
34
35 17 dependence on others for aspects of medicine taking like prompting medication times, and dependence for
36
37 18 ADLs such as collecting prescriptions and taking tablets out of boxes. In the postal survey, the inclusion of
38
39 19 stroke survivors regardless of level of dependence for ADLs permitted investigating a population who are
40
41 20 understudied,¹⁷ yet may have significant unmet needs that can affect their adherence to medications. This
42
43 21 investigation highlights caregivers' role in managing medicines in survivors dependent for ADLs.

44
45 22 However, study limitations should also be considered. The response rate across recruited GP practices
46
47 23 was low and harder to reach stroke survivors may have been missed. Poor response rate is a source of bias that
48
49 24 might affect our estimates.

50
51 25 Interestingly, considering the average age at stroke in England (i.e. 74 for men and 80 years for women¹⁹), our
52
53 26 participants' population was slightly younger (73 years), perhaps reflecting the fact that patients receiving
54
55 27 institutional long term care were excluded from the study or that older people found harder taking part in a
56
57 28 postal survey. Through the Barthel score, we did not assess cognition directly, although low cognitive function

1
2
3 1 is associated with poor adherence.³³ As the Barthel focuses on physical disability it is not known to what
4
5 2 extent study participants were cognitively impaired or suffered from communication difficulties like aphasia.
6
7 3 In addition, dependency for ADLs could have been caused by existing co-morbidities other than stroke. We
8
9 4 did not collect information on the use of blister packaged medication or devices to aid compliance, which
10
11 5 could have influenced medication taking practices. Finally this study examined all medicine taking and did not
12
13 6 differentiate between stroke secondary prevention medications and other drug categories.

7 **Comparisons with existing research**

8
9 8 To our knowledge this is the first study that shows that more than half of all stroke survivors get help
10
11 9 with some aspect of medicine taking and that those receiving help are more likely to have unmet needs. This
12
13 10 provides some insight in to why adherence to medication in stroke survivors may be poor.³⁴

14
15 11 Moreover, the greater the number of medicines, the more likely stroke survivors were to miss
16
17 12 medications. Addressing pill burden by simplifying drug regimens may be an important focus for future
18
19 13 interventions. Indeed the polypill approach to medication taking has been shown to reduce cardiovascular as
20
21 14 well as total pill burden in a primary care setting.³⁵ Simpler dosing regimens, are known to be associated with
22
23 15 better medication adherence³⁶ while fewer medicines has been shown to be an independent predictor of long
24
25 16 term medication persistence among stroke survivors.^{37 38} A recent trial incorporating a fixed-dose combination
26
27 17 polypill approach to taking cardiovascular medicine demonstrated better adherence among patients receiving a
28
29 18 single pill.³⁹

30
31 19 Receiving help with prescriptions and collecting medicines was identified as the area where most help
32
33 20 was received (49.7% of respondents). Stroke survivors who are dependent for activities of daily living may
34
35 21 face considerable practical challenges accessing health care resources at the pharmacy and the GP practice. A
36
37 22 recent study in the USA found that around 2/3 of caregivers were involved in at least 1 medication
38
39 23 management activity of elderly patients and that high involvement in Instrumental Activities of Daily Living
40
41 24 (IADLs) was associated with the caregiver providing the patient with assistance in ordering medicines.⁴⁰
42
43 25 Filling prescriptions is also known to be an important factor influencing medication adherence.^{41 42} Indeed
44
45 26 caregivers can play a significant role in ensuring appropriate medication taking. A recent interview study
46
47 27 exploring potential barriers and facilitators of medication adherence in stroke identified the central role of the
48
49 28 caregiver in medication adherence.⁴³ Our evaluation of an online stroke forum also confirmed the important

1
2
3 1 role of the caregiver in facilitating medication adherence.¹⁴ Monitoring prescription collections, liaising with
4
5 2 the GP and pharmacy, increasing the time between prescriptions or arranging medication deliveries, may help
6
7 3 to address prescription needs.

8
9 4 Around 11% of stroke survivors reported unmet medication needs. We found that stroke survivors
10
11 5 severely dependent for ADLs and receiving help with medicines were more likely to report unmet needs,
12
13 6 which is in line with a recent study investigating stroke/TIA survivors in Australia, where greater functional
14
15 7 ability was associated with fewer unmet needs, including those related to secondary prevention.⁴⁴ In previous
16
17 8 research on unmet needs among stroke survivors, a 44 item survey study by McKevitt and colleagues (2011)
18
19 9 reported that 49% of stroke survivors had at least one unmet need²⁵, while in a study of Australian survivors
20
21 10 who completed a 58 item survey, the percentage was 84%.²⁴ Both these studies however examined unmet
22
23 11 needs over a variety of domains including health, work, leisure and everyday living, social support and
24
25 12 finances, whereas our study focused on medication needs only.

26
27 13 Getting help to take medicines out of a box, packet or bottle was the area where the greatest proportion
28
29 14 of stroke survivors needed help all of the time. We previously found that the use of pill boxes and blister
30
31 15 packed medication to be both a facilitator³⁵ and a barrier¹⁴ to adherence among stroke survivors¹⁵, while
32
33 16 interventions using blister packaging and pill boxes have been found to be associated with improved
34
35 17 adherence.⁴⁵ Although electronic medication devices were considered potentially effective in improving
36
37 18 medication taking behaviour among patients with cognitive impairments, success in using such devices was
38
39 19 dependent on the patient having a good level of dexterity, while removing the medication from these devices
40
41 20 was also found to be challenging.^{46 47 48}

42
43 21 The need for further support in this domain, as reported in the current study, suggests that handling
44
45 22 medications remains problematic for stroke survivors.

46
47 23 An interesting finding from this survey study is that stroke survivors who missed medicines were
48
49 24 younger. This is consistent with other research on adherence in stroke that found that younger age was
50
51 25 predictive of poor adherence⁴⁹, and has also been described in patients taking medication for cardiovascular
52
53 26 disease.⁵⁰ The finding in the present study contrasts with the view that older patients are more likely to face
54
55 27 difficulties taking medication^{51 52} which is frequently attributed to higher number of pre-existing comorbidities
56
57 28 resulting in polypharmacy and increased complexity of medication taking regimens. The fact that older

1 patients may be less likely miss medicine might be down to the support they receive from caregivers. Our
2 findings suggests that support needed with medications may be overlooked in younger stroke survivors.⁵³

3 In this study a significant proportion of patients admitted missing medications occasionally. There is
4 evidence that improving adherence by one anti-hypertensive pill/week for a once-a-day regimen reduces the
5 hazard of stroke by 8–9 % and death by 7 %.⁵⁴ Each incremental 25% increase in proportion of days covered
6 with statin medications is associated with a 0.10 mmol/L reduction in LDL-C cholesterol.^{55 56} Non-adherence
7 to cardiovascular medications is associated with increased risk of morbidity and mortality.⁵⁷

8 9 **Implications for clinical practice**

10
11 A significant proportion of patients, particularly those who take large numbers of tablets, are disabled
12 or receive help to take medication, have unmet needs and miss their tablets, which can increase risk of
13 recurrent cardiovascular events. These particularly vulnerable groups of patients might benefit from focused
14 clinical attention. Through understanding the needs of survivors and caregivers in different aspects of daily
15 medication taking, we can help direct future resources to the areas of greatest need. For example, further
16 exploration of medication packaging is warranted to understand the difficulties stroke survivors face handling
17 medicines. Polypharmacy remains a difficulty for older patients. Therefore, exploring the use of combination
18 pills and further efforts to reduce the burden of multiple medications among stroke survivors is warranted.

19 The questionnaire we have developed could be used to understand the challenges around medication
20 faced by other patient groups. Unmet medication needs among UK stroke survivors have not been previously
21 explored in the context of activities both survivors and caregivers consider important for taking medicines.
22 Through understanding the extent of unmet needs as well as the areas in which these are greatest, strategies
23 can be developed which address poor medication taking practices and therefore improve medication
24 adherence.

25 **Future research**

26
27 Novel interventions focussing on the practicalities of taking medicines and aimed at improving stroke
28 survivors' adherence to treatment are needed. The findings reported here may inform the development of such

1
2
3 1 interventions. Advances in technology have the potential to facilitate delivery of such interventions, e.g.
4
5 2 electronic devices prompting medication taking times.^{58 59} Efforts to improve medication taking among
6
7 3 survivors of stroke using technology are already underway and have shown promise.⁶⁰ .

	All patients				Patients who receive any kind of help				Patients with unmet needs				Patients who miss medication			
	N	%	Mean	SD	N	%	Mean	SD	N	%	Mean	SD	N	%	Mean	SD
Age	588		72.7	11.6	331		73.6	12.2	64		68.8		203		70.5	13.0
Female	210	37.8			112	36.2			18	28.6			68	35.6		
Male	346	67.2			197	63.2			45	71.4			123	64.4		
Time since stroke	535		7.7	7.6	295		7.97	8.5	61		9.3	9.2	186		7.7	8.5
N of daily medicines	557		6.4	4	312		7.3	4.5	59		9.7	7.1	190		6.9	4.1
Independent for ADLs (BI=20)	139	28.3			53	18.9			5	9.8			45	25.7		
Moderately dependent for ADLs (BI=15-19)	231	47.1			130	46.4			17	33.3			84	48.0		
Severely dependent for ADLs (BI=0-14)	121	24.6			97	34.6			29	56.9			46	26.3		

Table 1. Characteristics of participants who took part in the survey study (*mean scores reported unless otherwise stated*). N represents the number of participants who completed the survey in respect to the different variables. BI: Barthel Index.

	N	All the Time N (%)	Often N (%)	Sometimes N (%)	Rarely N (%)	Never N (%)	Yes N (%)	No N (%)
Question 1 Is somebody helping with prescriptions and collection of your medicines?	583	186 (31.9)	19 (3.3)	40 (6.9)	45 (7.7)	293 (50.2)		
Question 1a Do you feel you need more help with prescriptions and collection of your medicines?	551						33 (6.0)	518 (94.0)
Question 2 Is somebody helping you getting the medicines out of the box, bottle or blister pack?	578	85 (14.7)	15 (2.6)	31 (5.4)	30 (5.2)	417 (72.1)		
Question 2a Do you feel you need more help with getting the medicines out of the box, bottle or blister pack?	553						33 (6.0)	520 (94.0)
Question 3 Is somebody helping with reminding you when is the time to take your medicine?	577	78 (13.6)	22 (3.8)	59 (10.2)	51 (8.8)	367 (63.6)		
Question 3a Do you feel you need more help with reminding when is the time to take your medicine?	564						35 (6.2)	529 (93.8)
Question 4 Is somebody helping you with swallowing your medicine?	579	56 (9.7)	11 (1.9)	29 (5.0)	21 (3.6)	462 (79.8)		
Question 4a Do you feel you need more help with swallowing your medicine?	560						9 (1.6)	551 (98.4)
Question 5 Is somebody helping you with checking that you have taken your medicines?	576	76 (13.2)	23 (4.0)	58 (10.0)	40 (6.9)	379 (65.9)		
Question 5 a Do you feel you need more help with checking that you have taken your medicine?	558						20 (3.6)	538 (96.4)
Thinking of the last 30 days, how often did you miss taking your regular medicines?	594	4 (0.7)	5 (0.8)	55 (9.3)	142 (23.9)	388 (65.3)		

Table 2. Results summarising participants' responses to the survey questions.

Variable	Univariable analysis		Multivariable analysis	
	N	Odds ratio (95% CI) p value	N	Odds ratio (95% CI) p value
Age ≥70	581	0.6 (0.4-1.1) p=0.084	544	0.7 (0.4-1.2) p=0.180
Gender (female)	544	0.7 (0.4-1.2) p=0.137	544	0.7 (0.4-1.2) p=0.147
Number of different medicines	542	1.2 (1.1-1.3) p<0.001	509	1.2 (1.1-1.3) p<0.001
Moderate Dependence for ADLs (BI: 15-19)	479	2.2 (0.8-6.1) p=0.135	447	2.7 (1.0-7.5) p=0.068
Severe Dependence for ADLs (BI: 0-14)	479	8.5 (3.2-22.8) p<0.001	447	11.6 (4.2-32.4) p<0.001
Years since stroke	522	1.0 (1.0-1.1) p=0.078	490	1.0 (1.0-1.1) p=0.160
Getting help with prescriptions and collection of medication	568	4.7 (2.5-8.8) p<0.001	533	4.6 (2.4-8.7) p<0.001
Getting help with taking medicines out of the box, bottle or blister pack	563	6.7 (3.8-11.8) p<0.001	527	6.6 (3.6-11.8) p<0.001
Getting help with reminding you when is the time to take your medicine?	562	4.7 (2.7-8.2) p<0.001	526	4.3 (2.4-7.6) p<0.001
Getting help to swallow the medication	565	6.7 (3.9-11.6) p<0.001	528	6.8 (3.8-12.0) p<0.001
Getting help by checking that you have taken your medicines	562	4.9 (2.8-8.6) p<0.001	526	5.9 (3.1-10.1) p<0.001
Getting any kind of help	574	5.9 (2.8-12.1) p<0.001	537	5.9 (2.7-11.6) p<0.001

Table 3. Results of the multivariable analysis showing the variables associated with unmet needs.

N: number of observations; ADLs: Activities of daily living; BI: Barthel Index.

Variable	Univariable analysis		Multivariable analysis	
	N	Odds Ratio (95% CI) p value	N	Odds Ratio (95% CI) p value
Age ≥70	594	0.6 (0.4-0.8) p=0.003	555	0.6 (0.4-0.9) p=0.006
Gender (female)	555	0.9 (0.6-1.2) p=0.401	555	0.9 (0.6-1.3) p=0.498
Number of different medicines	555	1.0 (1.0-1.1) p=0.040	520	1.1 (1.0-1.1) p=0.008
Moderate Dependence for ADLs (BI: 15-19)	490	1.2 (0.8-1.8) p=0.468	456	1.3 (0.8-2.0) p=0.343
Severe dependence for ADLs (BI 0-14)	490	1.3 (0.8-2.1) p=0.342	456	1.4 (0.8-2.4) p=0.239
Years since stroke	533	1.0 (0.9-1.0) p=0.950	499	1.0 (0.9-1.0) p=0.971
Getting help with prescriptions and collection of medication	581	2.0 (1.5-2.9) p<0.001	544	2.3 (1.6-3.3) p<0.001
Getting help to have the medicines out of the box, bottle or blister pack	576	1.4 (1.0-2.0) p=0.089	538	1.5 (1.0-2.2) p=0.051
Getting help with reminding you when is the time to take your medicine?	575	2.5 (1.7-3.6) p<0.001	537	2.7 (1.8-3.9) p<0.001
Getting help to swallow the medication	578	1.5 (1.0-2.3) p=0.045	539	1.7 (1.1-2.6) p=0.022
Getting help by checking that you have taken your medicines	576	2.4 (1.7-3.4) p<0.001	537	2.5 (1.7-3.7) p<0.001
Getting any kind of help	587	2.1 (1.4-3.0) p<0.001	548	2.1 (1.4-3.0) p<0.001
Unmet needs (participant reported more help needed)	580	5.3 (3.0-9.2) p<0.000	544	5.3 (3.0-9.4) p<0.001

Table 4. Results of univariable and multivariable analysis showing associations with missing medicines. N: number of observations; ADLs: Activities of daily living; BI: Barthel Index.

Variable	Unmet needs		Missing medication	
	N	Odds ratio (95% CI) p value	N	Odds ratio (95% CI) p value
Age ≥70	498	0.7 (0.4-1.2) p=0.248	508	0.6 (0.4-0.9) p=0.009
Gender (female)	498	0.7 (0.4-1.3) p=0.262	508	0.9 (0.6-1.3) p=0.576
Number of different medicines	465	1.2 (1.1-1.3) p<0.001	475	1.1 (1.0-1.1) p=0.015
Moderate Dependence for ADLs (BI: 15-19)	408	2.6 (0.9-7.5) p<0.075	417	0.3 (-0.2-0.7) p=0.289
Severe Dependence for ADLs (BI: 0-14)	408	10.9 (3.8-31.0) p<0.001	417	0.5 (-0.1-1.0) p=0.119
Years since stroke	446	1.0 (1.0-1.1) p=0.036	454	1.0 (0.9-1.03) p=0.725
Getting help with prescriptions and collection of medication	487	4.6 (2.4-8.9) p<0.001	497	2.6 (1.8-3.8) p<0.001
Getting help with taking medicines out of the box, bottle or blister pack	481	6.6 (3.6-12.2) p<0.001	491	1.7 (1.1-2.6) p=0.20
Getting help with reminding you when is the time to take your medicine?	480	4.7 (2.6-8.5) p<0.001	490	3.0 (2.0-4.5) p<0.001
Getting help to swallow the medication	482	7.8 (4.2-14.8) p<0.001	492	2.1 (1.3-3.4) p=0.005
Getting help by checking that you have taken your medicines	480	5.9 (3.2-10.9) p<0.001	490	2.8 (1.8-4.2) p<0.001
Getting any kind of help	491	5.6 (2.7-11.9) p<0.001	501	2.3 (1.6-3.4) p<0.001

Supplementary Appendix 1. Predictors of unmet needs and missing medication, responses given by patients only (i.e. caregivers' filled questionnaire excluded). Multivariable analyses, all models adjusted for age and gender. N: number of observations.

QUESTIONNAIRE – PATIENT

Many people with stroke need help with taking their medicines. We would like to ask you few questions about the help you might need with taking your medicines.

How many different type of medicines do you take in one day?
Write the number or an approximation. Please count all medications including eye drops, injections etc.

How old are you? How long ago was your stroke? years

What is your sex? M F

For each question below, please tick the box that best describes how you have taken your medicines in the last month:

1. Is somebody helping with prescriptions and collection of your medicines? all the time
often
sometimes
rarely
never

Do you feel you need more help with prescriptions and collection of your medicines?

Yes No

2. Is somebody helping you getting the medicines out of the box, bottle or blister pack? all the time
often
sometimes
rarely
never

Do you feel you need more help with getting the medicines out of the box, bottle or blister pack?

Yes No

Barthel Questionnaire

These are some questions about your ability to look after yourself.

They may not seem to apply to you.

Please answer them all.

Tick one box in each section.

Bathing

In the bath or shower do you:

manage on your own?

need help getting in and out?

Remember - tick one box only

need other help?

never have a bath or shower?

need to be washed in bed?

Stairs

Do you climb stairs at home:

without any help?

with someone carrying your frame?

Remember - tick one box only

with someone encouraging you?

with physical help?

not at all?

don't have stairs?

Dressing

Do you get dressed:

without any help?

just with help with buttons?

Remember - tick one box only

with someone helping you most of the time?

Mobility

Do you walk indoors:

without any help apart from a frame?

with one person watching over you?

Remember - tick one box only

with one person helping you?

with more than one person helping?

not at all?

Or do you use a wheelchair independently?
(e.g. round corners)

Transfer

Do you move from bed to chair:

on your own?

with a little help from one person?

Remember - tick one box only

with a lot of help from one or more people?

not at all?

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
--------------------------	--------------------------	--------------------------	--------------------------	--------------------------

Feeding

Do you eat food: without any help?
with help cutting food or spreading butter?
Remember - tick one box only with more help?

Toilet use

Do you use a toilet or commode: without any help?
with some help but can do something?
Remember - tick one box only with quite a lot of help?

Grooming

Do you brush your hair and teeth without help?
Wash your face and shave: with help?
Remember - tick one box only

Bladder

Are you incontinent of urine? never
less than once a week
Remember - tick one box only less than once a day
more often
Or do you have a catheter managed for you

Bowels

Do you soil yourself? never
Occasional accident
Remember - tick one box only all the time
or do you need someone to give you an enema?

Help with taking tablets after stroke

FAMILY MEMBER/FRIEND OR PRIVATE CARER COPY

Many people with stroke need help with taking their medicines. We would like to ask you few questions about the help you might be offering to your family member/friend/ patient with stroke with taking medicines.

Relation with your family member/friend with stroke

Are you:

partner
son or daughter
friend
carer from an agency
other
if other, please specify

Remember - tick one box only

How many different types of medicines does your family member/friend/patient with stroke take in one day?
Write the number or an approximation. Please count all medications including eye drops, injections etc.

How old is your family member/friend/patient with stroke? (years)

How many years ago was your family member/friend/patient's stroke?

What is your family member/friend/patient with stroke sex?

 M

 F

For each question below, please tick the box that best describes the help needed by your family member/friend/patient with stroke with taking medicines in the last month.

1. Is somebody helping your family member/friend/patient with stroke with prescriptions and collection of his/her medicines?

all the time
often
sometimes
rarely
never

Do you feel your family member/friend/patient with stroke needs more help with prescriptions and collection of his/her medicines?

Yes

No

1 **Conclusions**

2 More than half of patients who replied needed help with taking medication, and 1 in 10 had unmet needs in
3 this regard. Stroke survivors dependent on others have more unmet needs, more likely to miss medicines and
4 might benefit from focused clinical and research attention. Novel primary care interventions focusing on the
5 practicalities of taking medicines are warranted.

9 10 Article summary

11 Strengths and Limitations

- 12 • Development of the questionnaire was based on patients' and caregivers' own views gathered through
13 workshops.
- 14 • Stroke survivors were recruited from two UK regions.
- 15 • This work identified issues from a population that includes patients severely affected by stroke, who
16 are often excluded from research.
- 17 • Results shed light on the effect of stroke related impairments on practical domains and predictors of
18 medicine taking, which have significant effects on medication adherence and call for new primary care
19 interventions.
- 20 • The low response rate reported is a limitation of this study and stroke survivors who are harder to
21 reach may have been missed.

22
23 Funding: This study was funded by the RCGP SFB, Ref. SFB 2014 – 15 'Quantifying the support stroke
24 survivors get with daily medication taking: a questionnaire survey'. Anna De Simoni and Luis Ayerbe are
25 funded by a NIHR Academic Clinical Lectureships. This article therefore presents independent research
26 funded by NIHR. The views expressed are those of the authors and not necessarily those of the NHS, the
27 NIHR, or the Department of Health. James Jamison was supported by a research grant from The Stroke
28 Association and the British Heart Foundation: TSA BHF 2011/01

7

8 Introduction

9

10
11
12
13 6 Stroke is the leading cause of disability in developed countries, with an estimated that 25-74% of the
14
15 7 50 million stroke survivors worldwide requiring some assistance or being fully dependent on caregivers for
16
17 8 activities of daily living (ADLs).¹⁻³ For many older adults remaining independent at home may depend on how
18
19 9 well they can manage complex medication regimens.^{4,5} Around half of stroke survivors are dependent on
20
21 10 others for everyday activities.⁶

22
23 11 There is evidence that being dependent for ADLs and impairment in mobility and communication
24
25 12 decrease medication adherence in patients suffering from hypertension.⁷ Deficits in attention, cognition or
26
27 13 working memory have been linked with non-adherence to medications in other patient groups.⁸ In a recent
28
29 14 systematic review of medication adherence among patients with cognitive impairment, one third of studies
30
31 15 showed that such patients were likely to have a caregiver to assist with medications and there was an
32
33 16 association between taking four or more medicines and nonadherence.⁹ In patients taking cardiovascular
34
35 17 medicines, multiple factors including cognitive problems, lack of social support, dosing regimen, as well as
36
37 18 practical problems and difficulties accessing services, contribute to poor medication adherence.^{10 11} Low
38
39 19 adherence to secondary prevention medication is associated with poor cardiovascular health.^{12 13}

40
41 20 Stroke survivors have previously reported difficulties in the handling of medication as a barrier to
42
43 21 adherence to secondary prevention medication after stroke.¹⁴ This was true irrespective of age at stroke, with
44
45 22 younger and older stroke survivors being similarly affected.¹⁴ Research on medication adherence in stroke has
46
47 23 identified multiple barriers to medication taking among stroke survivors.¹⁴⁻¹⁶ However interventions developed
48
49 24 to improve adherence have mainly concentrated on patients responsible for their own medicine taking.^{17 18}

50
51 25 In England, the average age at stroke is 74 for men and 80 years for women.¹⁹ In elderly patients in
52
53 26 particular, cognitive deficits, taking large number of medicines and the complexity of medication regimens
54
55 27 have been identified as barriers to medication adherence.^{20 21} Caregivers are known to play a key role in

1
2
3 1 providing assistance to older people in a range of daily activities including medication taking and physician
4 visits,²² and can help improve adherence in cardiac patients with memory problems.²³
5
6
7 3
8
9 4
10

11 5 Survivors of stroke have previously reported unmet needs including physical difficulties, cognitive
12 and emotional difficulties, information needs and other unmet needs.^{24 25} However we know little about factors
13 that influence medication taking among stroke survivors with disabilities (i.e. physical or cognitive) living in
14 the community (i.e. not in nursing homes), their unmet needs around the use of medicines or the proportion
15 relying on caregivers for some or all aspects of medicine taking.
16
17 8
18
19 9

20 10 To date, survey instruments examining the unmet needs of stroke survivors have not focused on practical
21 aspects of medication taking such as how patients collect or handle their medicines.
22
23 11

24 12 The aims of this investigation were to design an instrument to evaluate the support stroke survivors get
25 with taking their medicines, characterise patients receiving help with medications, estimate the proportion who
26 have unmet needs with daily medicine taking and who miss medications. We additionally aimed to identify the
27 predictors of missing medicines and of experiencing unmet needs with medications.
28
29 14
30
31 15

32 16 This knowledge can inform the development of primary care interventions aimed at improving medication
33 taking in this patients' group.
34
35 17

36 18 Methods

37 19 38 39 19 40 41 20 **Questionnaire development workshops**

42 21 To develop the questionnaire, current literature evidence was evaluated¹⁷ and three workshops were
43 conducted with 26 stroke survivors and 12 caregivers in the East of England (St John's College, Cambridge
44 2009²⁶: 7 patients, 1 caregiver; Different Strokes, Cambridge 2012: 9 patients, 3 caregivers; Peterborough,
45 2012: 10 patients, 8 caregivers). Recruitment was opportunistic and no purposive sampling was applied. The
46 workshops were organised in the context of gathering Patient and Public Involvement (PPI) input into research
47 grant applications aimed at improving adherence to medication after stroke.¹⁷
48
49 24
50
51 25

52 26 The survey questions were developed through thematic analysis²⁷ of workshops field notes.
53
54
55 27
56
57
58
59

1
2
3 1 A fourth workshop was conducted to gather feedback on the questionnaire using a PPI (Patient and
4
5 2 Public Involvement) exercise with 11 stroke survivors and 3 caregivers recruited through a local stroke group
6
7 3 (Different Strokes, East of England). Two stroke survivors from this group took part in subsequent 'think-
8
9 4 aloud' interviews, which involved talking out loud as they read the questionnaire, continually verbalising what
10
11 5 they were thinking.
12
13 6

7 **Postal survey**

16
17 8 In respect to sample size, 400 returned questionnaires would allow good precision for prevalence estimates.
18
19 9 The 95% confidence intervals on various proportions with this sample size were calculated using the Wilson
20
21 10 score method (with continuity correction) and are as follows: 50% (45.00-55.00%), 25% (20.89%-29.60%),
22
23 11 5% (3.16-7.74%). With 600 questionnaires, the improvement in the precision of the estimates would be as
24
25 12 follows: 45.93%-54.07%, 21.62-28.70% and 3.46%-7.14% respectively.

26
27 13 General practices in primary care in the East of England and London were approached through the Clinical
28
29 14 Research Network (CRN). CRN Eastern contacted 20 GP practices, of which 11 replied and took part in the
30
31 15 study. CRN North London contacted 140 GP East London practices by email (Tower Hamlets, Newham and
32
33 16 City & Hackney CCGs), of which only two replied and participated in the study. Five of the eight GP practices
34
35 17 contacted in North London (Barnet CCG) through a research coordinator took part in the study.

36
37 18 Patients with stroke and their caregivers were sent the postal questionnaire according to the following criteria
38
39 19

20 Inclusion Criteria

21 Patients:

22 All patients aged > 18 on the practice stroke register with documented history of stroke.

23 Caregivers:

- 24 • Anyone identified by the patient as having a role helping with medicine taking.

25 Exclusion Criteria

- 26 • Patients who suffered a Transient ischaemic attack (TIA) but not a stroke.
- 27 • Palliative or end of life patients.

- 1 • Patients receiving institutional long term care (receiving total care in residential homes or living in
- 2 nursing homes).
- 3 • Patients considered unsuitable to taking part in the study by their GP.

5 **Survey participant identification**

6 A list of prospective patients was compiled from the stroke register of each surgery by the practice
7 staff. No restriction was placed on the recruitment of survivors who were dependent for ADLs or lacking
8 capacity. The list was screened by a practice GP and anyone not meeting the inclusion criteria or who was
9 considered unsuitable for the study was excluded. Reasons for unsuitability were not collected for practical
10 reasons.

12 **Survey participant recruitment**

13 Eligible participants were sent a study survey pack by practice staff between September 2016 and
14 February 2017. Study recruitment packs included two invitation letters, information sheets, questionnaires and
15 postal version of Barthel Index²⁸, one of which was for completion by the patient and the other by the
16 caregiver. The Barthel Index provides a measure of functional independence and physical functioning and has
17 been used in stroke research previously.²⁹ Patients with Barthel score 20 were categorised as independent for
18 ADLs, those with score 15-19 moderately dependent for ADLs, and those with scores 0-14 severely
19 dependent.³⁰ If receiving help with medications, the patient was asked to pass to their caregiver the invitation
20 letter and information sheet and invite him/her to complete their copy of the questionnaire, providing answers
21 on the patient's medicine taking. Family members, friends or paid caregivers of stroke survivors who were
22 severely disabled and/or lacked mental capacity were invited to fill and return the caregivers' questionnaires
23 only on behalf of patients. The information sheets stated that consent was implied by returning the completed
24 questionnaire. Participants were asked to return completed questionnaires to the research centre in the
25 FREEPOST envelopes provided. A second mail out of the study invitation pack was sent to all patients as a
26 reminder, 2 weeks after the first one.

Ethical approval

This study has received ethical approval from Cambridge Central Research Ethics Committee (REC reference: 16/EE/0182) and from the Health Research Authority (IRAS project ID: 170931)

Survey Analysis

Survey data entry was performed by Document Capture Company.³¹ Individual patients' characteristics (age, gender, time since stroke, number of daily medicines) were collected from the questionnaires themselves.

Practice population, number of patients on stroke registers, deprivation score and ethnicity were taken from the National General Practice profiles (<https://fingertips.phe.org.uk/profile/general-practice>). The proportions of patients in each sociodemographic category, needing help taking medication, missing any medication in the previous 30 days, and reporting the need for more help taking medication, were estimated. When the survivor and caregiver questionnaires were both returned together, study data were collected from the patient's questionnaire only. The associations between 'Unmet needs' and age (< or ≥70 years), gender, total number of medicines taken, dependence for ADLs, years since stroke, and receiving help with medicines were investigated with individual logistic regression models (a different model per variable investigated), adjusted each and all of them for age and gender. Individual logistic regression models adjusted for age and gender were also used to estimate the association between 'Missed medicines in the previous 30 days' and age (< or > 70 years), gender, total number of medicines taken, dependent for ADLs, years since stroke, help with medicines and unmet needs (a different model adjusted for age and gender per variable investigated).

Sensitivity analysis was conducted to investigate if predictors of missing medication or unmet needs vary when the analysis was done on the whole dataset *versus* on questionnaires filled by patients only.

Chi squared tests were used to compare the responses on unmet needs and missing medication given by patients *versus* caregivers.

All statistical analysis has been conducted with Stata (version 14, StataCorp LP, College Station, TX, USA, 2013).

Results

2 Questionnaire development

3 Taking medications emerged as an important issue in all three workshops: nearly half of patients
4 stated that a family member or friend was supporting them with daily medicine routines especially in relation
5 to prompting medicine taking. This was put down to effects of the stroke itself on memory retention rather
6 than general memory problems that people without stroke also experience. They admitted missing doses due to
7 forgetting. Only a small proportion of survivors were actually handling their own prescriptions and were
8 relying on support from family and/or community services. In one workshop almost all survivors had Dosette
9 medication boxes and agreed that taking medications out of safety bottles and blister packs was a problem due
10 to physical disabilities.

11 Thematic analysis of workshop data revealed five main practical domains of support needed with
12 medication taking: 1) Dealing with prescriptions and collection of medicines; 2) Getting medicines out of the
13 box, blister packs or bottles; 3) Prompting 'It's time to take your medicine'; 4) Swallowing medicines; and 5)
14 Checking whether medicines have been taken. The final study questionnaire (see Supplementary file 1)
15 included questions relating to each of these five domains, one item related to adherence (missed medicine in
16 the last 30 days) and an assessment of disabilities through completion of the validated postal version of the
17 Barthel Index.²⁸ The questionnaire was adapted for caregivers (see Supplementary file 2).

18 Questionnaire finalisation

19 On the basis of the fourth workshop and two 'think-aloud' interviews, we reworded the survey
20 questions (e.g. from 'Do you get help with' was changed into 'Is somebody helping you with') and used a
21 scale response 'All the time', 'Often', 'Sometimes', 'Rarely', 'Never' for the first question of each of the five
22 survey domains, which was originally conceived as a 'yes' or 'no' answer (see supplementary file for text of
23 questions).

Survey

2 **Practice characteristics**

3 18 GP practices agreed to take part in the study, of which just over 1/3 were in London (n=7). GP
4 practices were relatively large with an average population of 11,904 patients (SD = 4010) and a low to
5 moderate level of deprivation (Index of Multiple Deprivation³² (IMD): Mean-7.05: SD-3.19). Out of 3066
6 patients on the stroke registers, 1687 stroke patients (55%) were considered eligible for the study and received
7 the postal questionnaire. The average response rate of East of England and London practices was 42% and
8 27% respectively. The response rate varied between 16% and 53% across practices.

10 **Participant characteristics**

12 596 participants returned a completed questionnaire [549 (92.1 %) from patients, 47 (7.9 %) from
13 caregivers showing a mean response rate of 35% (0.33-0.37). Participants were on average 72.7 yrs old.
14 37.8% (n=210) of the sample were female, see table 1. There were a high proportion of white patients in the
15 recruited practices (79%), which were on average 21% of mixed or ethnic minority background.
16 Approximately 28% of study participants were completely independent for ADLs.

17 Participants getting any kind of help with medicines were on average 73.6 years old, two thirds were
18 male with only 19% of this group completely independent for ADLs.

20 Patients with unmet needs were on average 69 years old, predominantly male (71%) and 56.86% were
21 severely dependent for ADLs. Patients who missed medications were on average 70 years old, 64% were male
22 and the majority (48%) were moderately dependent for ADLs.

24 Table 1 here

1 Support with daily medication taking

2

3 Overall, 55.5% (95% CI: 51.7-59.7) of the participants received help in at least one aspect of taking
4 medication, in that they ticked one of the options from 'all the time' to 'rarely' on one or more of the five
5 questions related to medicine taking. 11% (95% CI: 8.8-13.9) of patients reported experiencing unmet needs
6 and needing more help with at least one of the aspects of taking medication, in that they ticked 'yes' to the
7 question "do you feel you need more help", on one or more of the five questions related to medicine taking.
8 The proportion of questionnaires reporting unmet needs filled in by caregivers, 19.6% (n=9), and by patients,
9 10.7% (n=57), had no significant difference (p=0.068).

10 Among participants help was needed to some degree with prescriptions and collection of medicines
11 (49.8 %), getting medicines out of the box or packet (27.9 %), reminding to take medicines (36.4 %),
12 swallowing medicines (20.2 %) and checking that medicines have been taken (34.1 %).(see Table 2). Being
13 reminded to take medicines, dealing with prescriptions and collection of medicines and getting medicines out
14 of a pack or bottle were the most commonly reported areas of unmet needs. Almost two thirds of participants
15 (65.3%) reported never missing medicines in the last 30 days. Out of the 34.7% of patients who said they
16 missed taking medicine at any point in the previous 30 days, 23.9% said rarely, 9.3% sometimes, 0.8% often
17 and 0.7% all the time. The proportion of questionnaires reporting missing medication at some point, filled in
18 by caregivers, 27.7% (n=13), and by patients 35.3% (n=193), had no significant difference (p=0.292).

19 Table 2 here

20 Factors associated with unmet needs

21 Being on a higher total number of daily medications (OR: 1.2, (1.1-1.3), p<0.001), severe
22 dependence for ADLs (OR: 11.6 (4.2-32.4) p<0.001) and receiving any kind of help (OR: 5.9, (2.7-11.6),
23 p<0.001) in relation to taking medication was associated with experiencing unmet needs. Getting help with
24 swallowing medicines (OR: 6.8, (3.8-12.0), p<0.001), getting medicines out of a box, blister packs or bottles
25 (OR: 6.6, (3.6-11.8), p<0.001) showed the strongest associations with experiencing unmet needs (see table 3).

1
2
3 1 When the analyses were conducted with data from questionnaires filled by patients only, the variables
4 significantly associated with unmet needs were the same, apart from years since stroke (Supplementary
5 2
6 3 Appendix 1).

7
8
9 4 Table 3 here
10
11 5
12 6
13 7

15 8 **Factors associated with missing medications**

16
17
18 9 Being older (age ≥ 70) was associated with a lower probability of missing medication (OR: 0.6
19
20 10 (0.4-0.9) $p=0.006$). Being on a higher number of daily medicines (polypharmacy) (OR: 1.1 (1.0-1.1), $p=0.008$)
21
22 11 and getting any kind of help with medicine taking (OR: 2.1 (1.4-3.0) $p<0.001$) was associated with higher
23
24 12 probability of missing medicines. The more unmet needs stroke survivors had with taking medication, the
25
26 13 more likely they were to miss their medicines (OR: 5.3 (3.0-9.4), $p<0.001$). (see Table 4). When the analyses
27
28 14 were conducted with data from questionnaires filled by patients only, the variables significantly associated
29
30 15 with missing medication were the same (Supplementary Appendix 1).

44 20 **Discussion**

47 21 **Summary of findings**

48
49
50 22 From workshops we identified 5 key issues that patients regarded as important with medication taking
51
52 23 after stroke. We converted these into a five item questionnaire that we distributed to people on stroke registers
53
54 24 in 18 general practices. We obtained a response rate of 35%. Among respondents, 56% of survivors in the
55
56 25 community were receiving help in some aspect of daily medication taking, 11% reported needing more help in
57
58
59
60

1
2
3 1 at least one domain of medicine taking and 34% missed taking their medicines at some point in the previous
4
5 2 30 days.

6
7 3 A higher total number of daily medicines, being severely dependent for ADLs and receiving help with
8
9 4 medication were predictors of experiencing at least one unmet need in respect of medication taking. Stroke
10
11 5 survivors who were younger, taking a higher number of daily medicines and experiencing a greater number of
12
13 6 unmet needs were more likely to miss medications.

14
15 7 This work identified issues from a population that includes patients severely affected by stroke, who are often
16
17 8 excluded from research.¹⁷ Results presented here shed light on the effect of stroke related impairments on
18
19 9 practical domains and predictors of medicine taking, which are shown to have significant effects on overall
20
21 10 adherence.

22
23 11

24
25 12

26 27 13 **Strengths and limitations**

28
29 14 A strength of this study is that the questionnaire was developed from patients' and caregivers' own
30
31 15 views gathered through workshops. Although not recruited through purposive sampling, workshop participants
32
33 16 suffered from a range of stroke related impairments, as highlighted by the reported use of Dossette boxes,
34
35 17 dependence on others for aspects of medicine taking like prompting medication times, and dependence for
36
37 18 ADLs such as collecting prescriptions and taking tablets out of boxes. In the postal survey, the inclusion of
38
39 19 stroke survivors regardless of level of dependence for ADLs permitted investigating a population who are
40
41 20 understudied,¹⁷ yet may have significant unmet needs that can affect their adherence to medications. This
42
43 21 investigation highlights caregivers' role in managing medicines in survivors dependent for ADLs.

44
45 22 However, study limitations should also be considered. The response rate across recruited GP practices
46
47 23 was low and harder to reach stroke survivors may have been missed. Poor response rate is a source of bias that
48
49 24 might affect our estimates.

50
51 25 Interestingly, considering the average age at stroke in England (i.e. 74 for men and 80 years for women¹⁹), our
52
53 26 participants' population was slightly younger (73 years), perhaps reflecting the fact that patients receiving
54
55 27 institutional long term care were excluded from the study or that older people found harder taking part in a
56
57 28 postal survey. Through the Barthel score, we did not assess cognition directly, although low cognitive function

1
2
3 1 is associated with poor adherence.³³ As the Barthel focuses on physical disability it is not known to what
4
5 2 extent study participants were cognitively impaired or suffered from communication difficulties like aphasia.
6
7 3 In addition, dependency for ADLs could have been caused by existing co-morbidities other than stroke. We
8
9 4 did not collect information on the use of blister packaged medication or devices to aid compliance, which
10
11 5 could have influenced medication taking practices. Finally this study examined all medicine taking and did not
12
13 6 differentiate between stroke secondary prevention medications and other drug categories.
14
15 7

8 **Comparisons with existing research**

9
10
11
12
13
14
15
16
17
18
19 9 To our knowledge this is the first study that shows that more than half of all stroke survivors get help
20
21 10 with some aspect of medicine taking and that those receiving help are more likely to have unmet needs. This
22
23 11 provides some insight in to why adherence to medication in stroke survivors may be poor.³⁴

24
25 12 Moreover, the greater the number of medicines, the more likely stroke survivors were to miss
26
27 13 medications. Addressing pill burden by simplifying drug regimens may be an important focus for future
28
29 14 interventions. Indeed the polypill approach to medication taking has been shown to reduce cardiovascular as
30
31 15 well as total pill burden in a primary care setting.³⁵ Simpler dosing regimens, are known to be associated with
32
33 16 better medication adherence³⁶ while fewer medicines has been shown to be an independent predictor of long
34
35 17 term medication persistence among stroke survivors.^{37 38} A recent trial incorporating a fixed-dose combination
36
37 18 polypill approach to taking cardiovascular medicine demonstrated better adherence among patients receiving a
38
39 19 single pill.³⁹

40
41 20 Receiving help with prescriptions and collecting medicines was identified as the area where most help
42
43 21 was received (49.7% of respondents). Stroke survivors who are dependent for activities of daily living may
44
45 22 face considerable practical challenges accessing health care resources at the pharmacy and the GP practice. A
46
47 23 recent study in the USA found that around 2/3 of caregivers were involved in at least 1 medication
48
49 24 management activity of elderly patients and that high involvement in Instrumental Activities of Daily Living
50
51 25 (IADLs) was associated with the caregiver providing the patient with assistance in ordering medicines.⁴⁰
52
53 26 Filling prescriptions is also known to be an important factor influencing medication adherence.^{41 42} Indeed
54
55 27 caregivers can play a significant role in ensuring appropriate medication taking. A recent interview study
56
57 28 exploring potential barriers and facilitators of medication adherence in stroke identified the central role of the

1
2
3 1 caregiver in medication adherence.⁴³ Our evaluation of an online stroke forum also confirmed the important
4
5 2 role of the caregiver in facilitating medication adherence.¹⁴ Monitoring prescription collections, liaising with
6
7 3 the GP and pharmacy, increasing the time between prescriptions or arranging medication deliveries, may help
8
9 4 to address prescription needs.

10
11 5 Around 11% of stroke survivors reported unmet medication needs. We found that stroke survivors
12
13 6 severely dependent for ADLs and receiving help with medicines were more likely to report unmet needs,
14
15 7 which is in line with a recent study investigating stroke/TIA survivors in Australia, where greater functional
16
17 8 ability was associated with fewer unmet needs, including those related to secondary prevention.⁴⁴ In previous
18
19 9 research on unmet needs among stroke survivors, a 44 item survey study by McKeivitt and colleagues (2011)
20
21 10 reported that 49% of stroke survivors had at least one unmet need²⁵, while in a study of Australian survivors
22
23 11 who completed a 58 item survey, the percentage was 84%.²⁴ Both these studies however examined unmet
24
25 12 needs over a variety of domains including health, work, leisure and everyday living, social support and
26
27 13 finances, whereas our study focused on medication needs only.

28
29 14 Getting help to take medicines out of a box, packet or bottle was the area where the greatest proportion
30
31 15 of stroke survivors needed help all of the time. We previously found that the use of pill boxes and blister
32
33 16 packed medication to be both a facilitator³⁵ and a barrier¹⁴ to adherence among stroke survivors¹⁵, while
34
35 17 interventions using blister packaging and pill boxes have been found to be associated with improved
36
37 18 adherence.⁴⁵ Although electronic medication devices were considered potentially effective in improving
38
39 19 medication taking behaviour among patients with cognitive impairments, success in using such devices was
40
41 20 dependent on the patient having a good level of dexterity, while removing the medication from these devices
42
43 21 was also found to be challenging.^{46 47 48}

44
45 22 The need for further support in this domain, as reported in the current study, suggests that handling
46
47 23 medications remains problematic for stroke survivors.

48
49 24 An interesting finding from this survey study is that stroke survivors who missed medicines were
50
51 25 younger. This is consistent with other research on adherence in stroke that found that younger age was
52
53 26 predictive of poor adherence⁴⁹, and has also been described in patients taking medication for cardiovascular
54
55 27 disease.⁵⁰ The finding in the present study contrasts with the view that older patients are more likely to face
56
57 28 difficulties taking medication^{51 52} which is frequently attributed to higher number of pre-existing comorbidities

1
2
3 1 resulting in polypharmacy and increased complexity of medication taking regimens. The fact that older
4
5 2 patients may be less likely miss medicine might be down to the support they receive from caregivers. Our
6
7 3 findings suggests that support needed with medications may be overlooked in younger stroke survivors.⁵³

8
9 4 In this study a significant proportion of patients admitted missing medications occasionally. There is
10
11 5 evidence that improving adherence by one anti-hypertensive pill/week for a once-a-day regimen reduces the
12
13 6 hazard of stroke by 8–9 % and death by 7 %.⁵⁴ Each incremental 25% increase in proportion of days covered
14
15 7 with statin medications is associated with a 0.10 mmol/L reduction in LDL-C cholesterol.^{55 56} Non-adherence
16
17 8 to cardiovascular medications is associated with increased risk of morbidity and mortality.⁵⁷

10 **Implications for clinical practice**

11
12 A significant proportion of patients, particularly those who take large numbers of tablets, are disabled
13
14 or receive help to take medication, have unmet needs and miss their tablets, which can increase risk of
15
16 recurrent cardiovascular events. These particularly vulnerable groups of patients might benefit from focused
17
18 clinical attention. Through understanding the needs of survivors and caregivers in different aspects of daily
19
20 medication taking, we can help direct future resources to the areas of greatest need. For example, further
21
22 exploration of medication packaging is warranted to understand the difficulties stroke survivors face handling
23
24 medicines. Polypharmacy remains a difficulty for older patients. Therefore, exploring the use of combination
25
26 pills and further efforts to reduce the burden of multiple medications among stroke survivors is warranted.

27
28 The questionnaire we have developed could be used to understand the challenges around medication
29
30 faced by other patient groups. Unmet medication needs among UK stroke survivors have not been previously
31
32 explored in the context of activities both survivors and caregivers consider important for taking medicines.
33
34 Through understanding the extent of unmet needs as well as the areas in which these are greatest, strategies
35
36 can be developed which address poor medication taking practices and therefore improve medication
37
38 adherence.

1
2
3 **1 Future research**

4
5 2
6
7 3 Novel interventions focussing on the practicalities of taking medicines and aimed at improving stroke
8
9 4 survivors' adherence to treatment are needed. The findings reported here may inform the development of such
10
11 5 interventions. Advances in technology have the potential to facilitate delivery of such interventions, e.g.
12
13 6 electronic devices prompting medication taking times.^{58 59} Efforts to improve medication taking among
14
15 7 survivors of stroke using technology are already underway and have shown promise.⁶⁰

	All patients				Patients who receive any kind of help				Patients with unmet needs				Patients who miss medication			
	N	%	Mean	SD	N	%	Mean	SD	N	%	Mean	SD	N	%	Mean	SD
Age	588		72.7	11.6	331		73.6	12.2	64		68.8		203		70.5	13.0
Female	210	37.8			112	36.2			18	28.6			68	35.6		
Male	346	67.2			197	63.2			45	71.4			123	64.4		
Time since stroke	535		7.7	7.6	295		7.97	8.5	61		9.3	9.2	186		7.7	8.5
N of daily medicines	557		6.4	4	312		7.3	4.5	59		9.7	7.1	190		6.9	4.1
Independent for ADLs (BI=20)	139	28.3			53	18.9			5	9.8			45	25.7		
Moderately dependent for ADLs (BI=15-19)	231	47.1			130	46.4			17	33.3			84	48.0		
Severely dependent for ADLs (BI=0-14)	121	24.6			97	34.6			29	56.9			46	26.3		

Table 1. Characteristics of participants who took part in the survey study (*mean scores reported unless otherwise stated*). N represents the number of participants who completed the survey in respect to the different variables. BI: Barthel Index.

	N	All the Time N (%)	Often N (%)	Sometimes N (%)	Rarely N (%)	Never N (%)	Yes N (%)	No N (%)
Question 1 Is somebody helping with prescriptions and collection of your medicines?	583	186 (31.9)	19 (3.3)	40 (6.9)	45 (7.7)	293 (50.2)		
Question 1a Do you feel you need more help with prescriptions and collection of your medicines?	551						33 (6.0)	518 (94.0)
Question 2 Is somebody helping you getting the medicines out of the box, bottle or blister pack?	578	85 (14.7)	15 (2.6)	31 (5.4)	30 (5.2)	417 (72.1)		
Question 2a Do you feel you need more help with getting the medicines out of the box, bottle or blister pack?	553						33 (6.0)	520 (94.0)
Question 3 Is somebody helping with reminding you when is the time to take your medicine?	577	78 (13.6)	22 (3.8)	59 (10.2)	51 (8.8)	367 (63.6)		
Question 3a Do you feel you need more help with reminding when is the time to take your medicine?	564						35 (6.2)	529 (93.8)
Question 4 Is somebody helping you with swallowing your medicine?	579	56 (9.7)	11 (1.9)	29 (5.0)	21 (3.6)	462 (79.8)		
Question 4a Do you feel you need more help with swallowing your medicine?	560						9 (1.6)	551 (98.4)
Question 5 Is somebody helping you with checking that you have taken your medicines?	576	76 (13.2)	23 (4.0)	58 (10.0)	40 (6.9)	379 (65.9)		
Question 5 a Do you feel you need more help with checking that you have taken your medicine?	558						20 (3.6)	538 (96.4)
Thinking of the last 30 days, how often did you miss taking your regular medicines?	594	4 (0.7)	5 (0.8)	55 (9.3)	142 (23.9)	388 (65.3)		

Table 2. Results summarising participants' responses to the survey questions.

Variable	Univariable analysis		Multivariable analysis	
	N	Odds ratio (95% CI) p value	N	Odds ratio (95% CI) p value
Age ≥70	581	0.6 (0.4-1.1) p=0.084	544	0.7 (0.4-1.2) p=0.180
Gender (female)	544	0.7 (0.4-1.2) p=0.137	544	0.7 (0.4-1.2) p=0.147
Number of different medicines	542	1.2 (1.1-1.3) p<0.001	509	1.2 (1.1-1.3) p<0.001
Moderate Dependence for ADLs (BI: 15-19)	479	2.2 (0.8-6.1) p=0.135	447	2.7 (1.0-7.5) p=0.068
Severe Dependence for ADLs (BI: 0-14)	479	8.5 (3.2-22.8) p<0.001	447	11.6 (4.2-32.4) p<0.001
Years since stroke	522	1.0 (1.0-1.1) p=0.078	490	1.0 (1.0-1.1) p=0.160
Getting help with prescriptions and collection of medication	568	4.7 (2.5-8.8) p<0.001	533	4.6 (2.4-8.7) p<0.001
Getting help with taking medicines out of the box, bottle or blister pack	563	6.7 (3.8-11.8) p<0.001	527	6.6 (3.6-11.8) p<0.001
Getting help with reminding you when is the time to take your medicine?	562	4.7 (2.7-8.2) p<0.001	526	4.3 (2.4-7.6) p<0.001
Getting help to swallow the medication	565	6.7 (3.9-11.6) p<0.001	528	6.8 (3.8-12.0) p<0.001
Getting help by checking that you have taken your medicines	562	4.9 (2.8-8.6) p<0.001	526	5.9 (3.1-10.1) p<0.001
Getting any kind of help	574	5.9 (2.8-12.1) p<0.001	537	5.9 (2.7-11.6) p<0.001

Table 3. Results of the multivariable analysis showing the variables associated with unmet needs.

N: number of observations; ADLs: Activities of daily living; BI: Barthel Index.

Variable	Univariable analysis		Multivariable analysis	
	N	Odds Ratio (95% CI) p value	N	Odds Ratio (95% CI) p value
Age ≥70	594	0.6 (0.4-0.8) p=0.003	555	0.6 (0.4-0.9) p=0.006

Moderate Dependence for ADLs (BI: 15-19)	490	1.2 (0.8-1.8) p=0.468	456	1.3 (0.8-2.0) p=0.343
Severe dependence for ADLs (BI 0-14)	490	1.3 (0.8-2.1) p=0.342	456	1.4 (0.8-2.4) p=0.239
Years since stroke	533	1.0 (0.9-1.0) p=0.950	499	1.0 (0.9-1.0) p=0.971
Getting help with prescriptions and collection of medication	581	2.0 (1.5-2.9) p<0.001	544	2.3 (1.6-3.3) p<0.001
Getting help to have the medicines out of the box, bottle or blister pack	576	1.4 (1.0-2.0) p=0.089	538	1.5 (1.0-2.2) p=0.051
Getting help with reminding you when is the time to take your medicine?	575	2.5 (1.7-3.6) p<0.001	537	2.7 (1.8-3.9) p<0.001
Getting help to swallow the medication	578	1.5 (1.0-2.3) p=0.045	539	1.7 (1.1-2.6) p=0.022
Getting help by checking that you have taken your medicines	576	2.4 (1.7-3.4) p<0.001	537	2.5 (1.7-3.7) p<0.001
Getting any kind of help	587	2.1 (1.4-3.0) p<0.001	548	2.1 (1.4-3.0) p<0.001
Unmet needs (participant reported more help needed)	580	5.3 (3.0-9.2) p<0.000	544	5.3 (3.0-9.4) p<0.001

Table 4. Results of univariable and multivariable analysis showing associations with missing medicines. N: number of observations; ADLs: Activities of daily living; BI: Barthel Index.

Variable	Unmet needs		Missing medication	
	N	Odds ratio (95% CI) p value	N	Odds ratio (95% CI) p value
Age ≥70	498	0.7 (0.4-1.2) p=0.248	508	0.6 (0.4-0.9) p=0.009
Gender (female)	498	0.7 (0.4-1.3) p=0.262	508	0.9 (0.6-1.3) p=0.576
Number of different medicines	465	1.2 (1.1-1.3) p<0.001	475	1.1 (1.0-1.1) p=0.015
Moderate Dependence for ADLs (BI: 15-19)	408	2.6 (0.9-7.5) p<0.075	417	0.3 (-0.2-0.7) p=0.289
Severe Dependence for ADLs (BI: 0-14)	408	10.9 (3.8-31.0) p<0.001	417	0.5 (-0.1-1.0) p=0.119
Years since stroke	446	1.0 (1.0-1.1) p=0.036	454	1.0 (0.9-1.03) p=0.725
Getting help with prescriptions and collection of medication	487	4.6 (2.4-8.9) p<0.001	497	2.6 (1.8-3.8) p<0.001
Getting help with taking medicines out of the box, bottle or blister pack	481	6.6 (3.6-12.2) p<0.001	491	1.7 (1.1-2.6) p=0.20
Getting help with reminding you when is the time to take your medicine?	480	4.7 (2.6-8.5) p<0.001	490	3.0 (2.0-4.5) p<0.001
Getting help to swallow the medication	482	7.8 (4.2-14.8) p<0.001	492	2.1 (1.3-3.4) p=0.005
Getting help by checking that you have taken your medicines	480	5.9 (3.2-10.9) p<0.001	490	2.8 (1.8-4.2) p<0.001
Getting any kind of help	491	5.6 (2.7-11.9) p<0.001	501	2.3 (1.6-3.4) p<0.001

Supplementary Appendix 1. Predictors of unmet needs and missing medication, responses given by patients only (i.e. caregivers' filled questionnaire excluded). Multivariable analyses, all models adjusted for age and gender. N: number of observations.

QUESTIONNAIRE – PATIENT

Many people with stroke need help with taking their medicines. We would like to ask you few questions about the help you might need with taking your medicines.

How many different type of medicines do you take in one day?
Write the number or an approximation. Please count all medications including eye drops, injections etc.

How old are you? How long ago was your stroke? years

What is your sex? M F

For each question below, please tick the box that best describes how you have taken your medicines in the last month:

1. Is somebody helping with prescriptions and collection of your medicines? all the time
often
sometimes
rarely
never

Do you feel you need more help with prescriptions and collection of your medicines?

Yes No

2. Is somebody helping you getting the medicines out of the box, bottle or blister pack? all the time
often
sometimes
rarely
never

Do you feel you need more help with getting the medicines out of the box, bottle or blister pack?

Yes No

Remember - tick one box only

Barthel Questionnaire

These are some questions about your ability to look after yourself.

They may not seem to apply to you.

Please answer them all.

Tick one box in each section.

Bathing

In the bath or shower do you:

manage on your own?

need help getting in and out?

Remember - tick one box only

need other help?

never have a bath or shower?

need to be washed in bed?

Stairs

Do you climb stairs at home:

without any help?

with someone carrying your frame?

Remember - tick one box only

with someone encouraging you?

with physical help?

not at all?

don't have stairs?

Dressing

Do you get dressed:

without any help?

just with help with buttons?

Remember - tick one box only

with someone helping you most of the time?

Mobility

Do you walk indoors:

without any help apart from a frame?

with one person watching over you?

Remember - tick one box only

with one person helping you?

with more than one person helping?

not at all?

Or do you use a wheelchair independently?
(e.g. round corners)

Transfer

Do you move from bed to chair:

on your own?

with a little help from one person?

Remember - tick one box only

with a lot of help from one or more people?

not at all?

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Feeding

Do you eat food: without any help?
with help cutting food or spreading butter?
Remember - tick one box only with more help?

Toilet use

Do you use a toilet or commode: without any help?
with some help but can do something?
Remember - tick one box only with quite a lot of help?

Grooming

Do you brush your hair and teeth without help?
Wash your face and shave: with help?
Remember - tick one box only

Bladder

Are you incontinent of urine? never
less than once a week
Remember - tick one box only less than once a day
more often
Or do you have a catheter managed for you

Bowels

Do you soil yourself? never
Occasional accident
Remember - tick one box only all the time
or do you need someone to give you an enema?

.

Help with taking tablets after stroke

FAMILY MEMBER/FRIEND OR PRIVATE CARER COPY

Many people with stroke need help with taking their medicines. We would like to ask you few questions about the help you might be offering to your family member/friend/ patient with stroke with taking medicines.

Relation with your family member/friend with stroke

Are you:

Remember - tick one box only

- partner
- son or daughter
- friend
- carer from an agency
- other
- if other, please specify

How many different types of medicines does your family member/friend/patient with stroke take in one day?
Write the number or an approximation. Please count all medications including eye drops, injections etc.

How old is your family member/friend/patient with stroke? (years)

How many years ago was your family member/friend/patient's stroke?

What is your family member/friend/patient with stroke sex?

M F

For each question below, please tick the box that best describes the help needed by your family member/friend/patient with stroke with taking medicines in the last month.

1. Is somebody helping your family member/friend/patient with stroke with prescriptions and collection of his/her medicines?

- all the time
- often
- sometimes
- rarely
- never

Do you feel your family member/friend/patient with stroke needs more help with prescriptions and collection of his/her medicines?

Yes

No

.

2. Is somebody helping your family member/friend/patient with stroke getting the medicines out of the box, bottle or blister pack?

all the time
often
sometimes
rarely
never

Do you feel your family member/friend/patient with stroke needs more help with getting the medicines out of the box, bottle, or blister pack?

Yes No

3. Is somebody helping your family member/friend/patient with stroke with reminding when is time to take his/her medicine?

all the time
often
sometimes
rarely
never

Do you feel your family member/friend/patient with stroke needs more help with reminding when is time to take his/her medicine?

Yes No

4. Is somebody helping your family member/friend/patient with stroke with swallowing his/her medicine? For example by giving a drink.

all the time
often
sometimes
rarely
never

Do you feel you your family member/friend/patient with stroke need more help with swallowing his/her medicine?

Yes No

5. Is somebody helping your family member/friend/patient with stroke with checking that he/she has taken his/her medicines?

all the time
often
sometimes
rarely
never

Do you feel your family member/friend/patient with stroke needs more help with checking that he/she has taken his/her medicine?

Yes No

Missing medicines

Thinking of the last 30 days, how often did your family member/friend/patient with stroke miss taking his/her regular medicines?

- all the time
- often
- sometimes
- rarely
- never

Remember - tick one box only

Barthel Questionnaire

These are some questions about the ability of your family member/friend/patient with stroke to look after him/herself.

Please answer them all.

Please fill this questionnaire even if you are not regularly caring for your family member/friend/patient with stroke, trying to answer questions in the way you think most accurately describes the disability of your family member/friend/patient with stroke.

Tick one box in each section.

Bathing

In the bath or shower do you:

- manage on your own?
- need help getting in and out?
- need other help?
- never have a bath or shower?
- need to be washed in bed?

Remember - tick one box only

Stairs

Do you climb stairs at home:

- without any help?
- with someone carrying your frame?
- with someone encouraging you?
- with physical help?
- not at all?
- don't have stairs?

Remember - tick one box only

Dressing

STROBE 2007 (v4) Statement—Checklist of items that should be included in reports of *cross-sectional studies*

Section/Topic	Item #	Recommendation	Reported on page #
Title and abstract	1	(a) Indicate the study’s design with a commonly used term in the title or the abstract	2
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	4-5
Objectives	3	State specific objectives, including any pre-specified hypotheses	5
Methods			
Study design	4	Present key elements of study design early in the paper	5-6
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	6
Participants	6	(a) Give the eligibility criteria, and the sources and methods of selection of participants	6-7
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	9
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	8
Bias	9	Describe any efforts to address potential sources of bias	-
Study size	10	Explain how the study size was arrived at	6
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	8-9
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	8-9
		(b) Describe any methods used to examine subgroups and interactions	8-9
		(c) Explain how missing data were addressed	-
		(d) If applicable, describe analytical methods taking account of sampling strategy	-
		(e) Describe any sensitivity analyses	-

Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed (b) Give reasons for non-participation at each stage	10 -
		(c) Consider use of a flow diagram	-
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders (b) Indicate number of participants with missing data for each variable of interest	10 -
Outcome data	15*	Report numbers of outcome events or summary measures	
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included (b) Report category boundaries when continuous variables were categorized (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	11-12 - -
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	-
Discussion			
Key results	18	Summarise key results with reference to study objectives	12-13
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	13-14
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	14-16
Generalisability	21	Discuss the generalisability (external validity) of the study results	17
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	3

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.
