

Supplemental Figure 1. Relative abundance of the 30 most abundant operational taxonomic units (OTUs) before and after dietary intervention in subjects with paired baseline and 6-month samples.

A. Mediterranean Arm

B. Healthy Eating Arm**Baseline****6 Months**

Supplemental Table 1. Spearman correlation coefficients of the relative abundance of bacteria from colonic mucosa with BMI, serum measures of metabolic health and serum carotenoids at baseline in 88 subjects. Significant associations, after correction for false discovery rates (FDR) using the Benjamini-Hochberg method ($p \leq 0.015$), are starred. There were no significant correlations of bacterial variables with age after FDR correction. The phyla, families and genera shown are from summing appropriate operational taxonomic units (OTUs) after subsampling data to 1047 sequences per sample.
