Figure S1: Images of all examined bath toys, both sound and cut open. A-L: bath toys from real households.

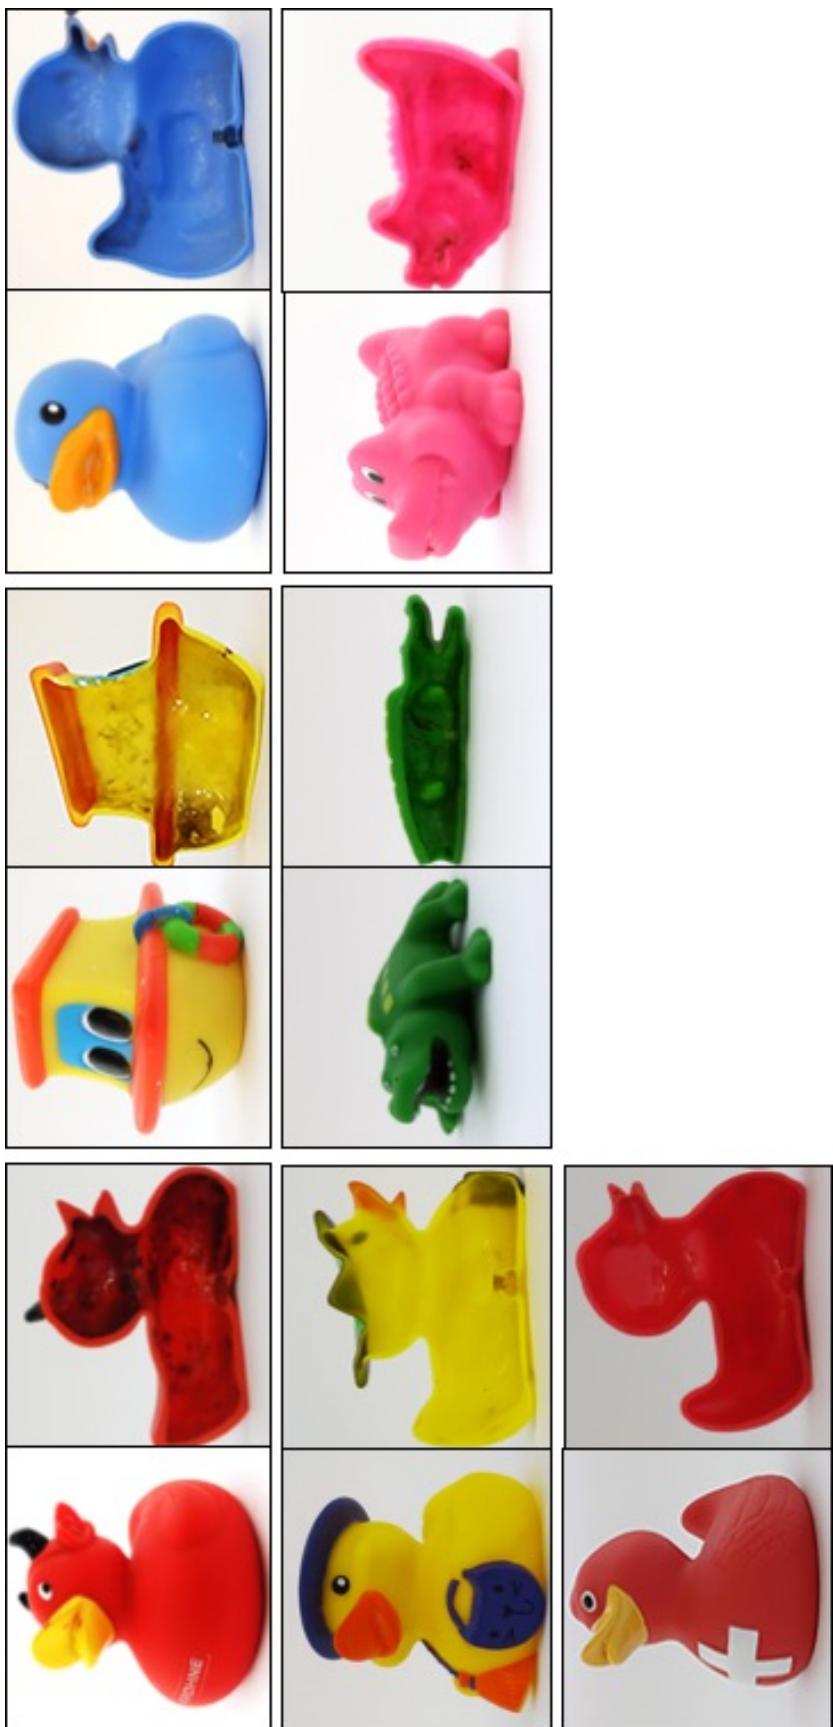

Figure S1: Images of all examined bath toys, both sound and cut open. M-S: bath toys from real households.

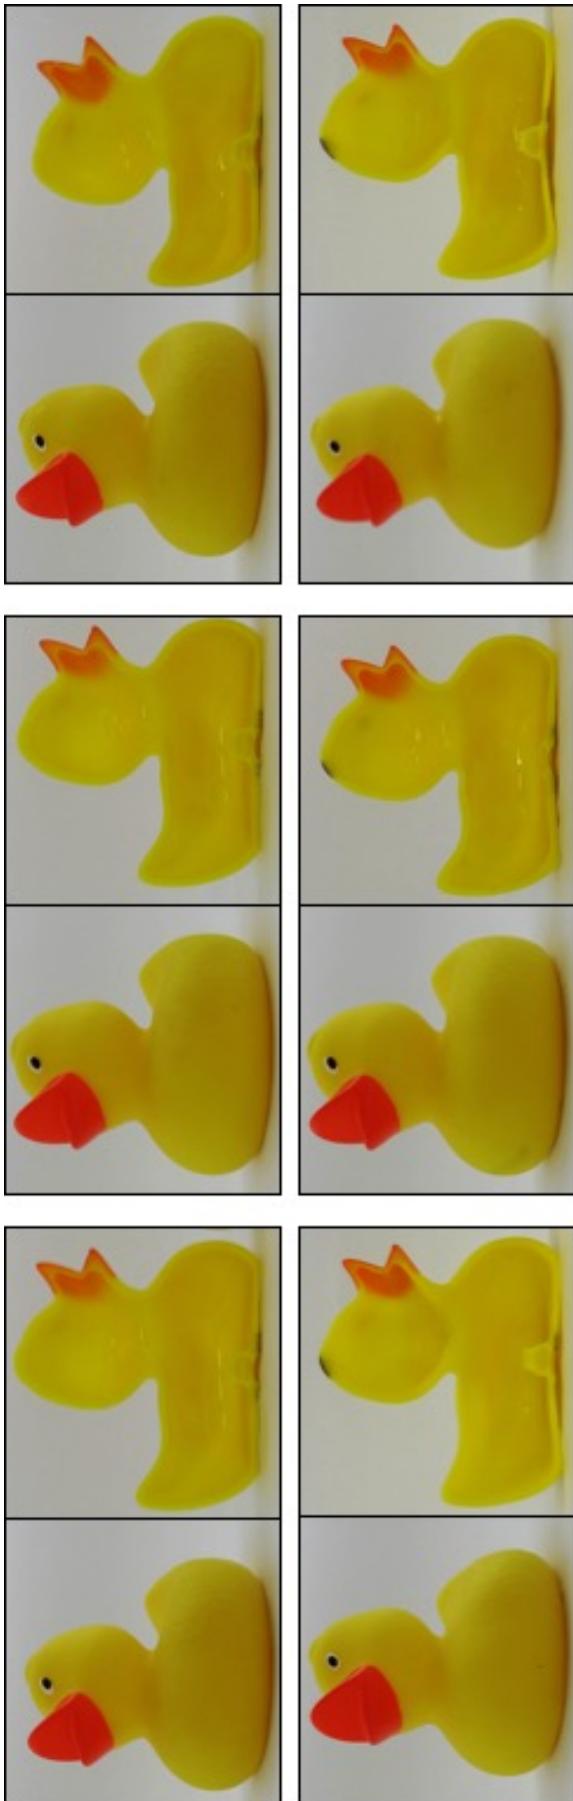

Figure S1: Images T-V: control bath toys processed with water prior to bathing (clean water controls). W-Y: control bath toys used with water after bathing (dirty water controls).

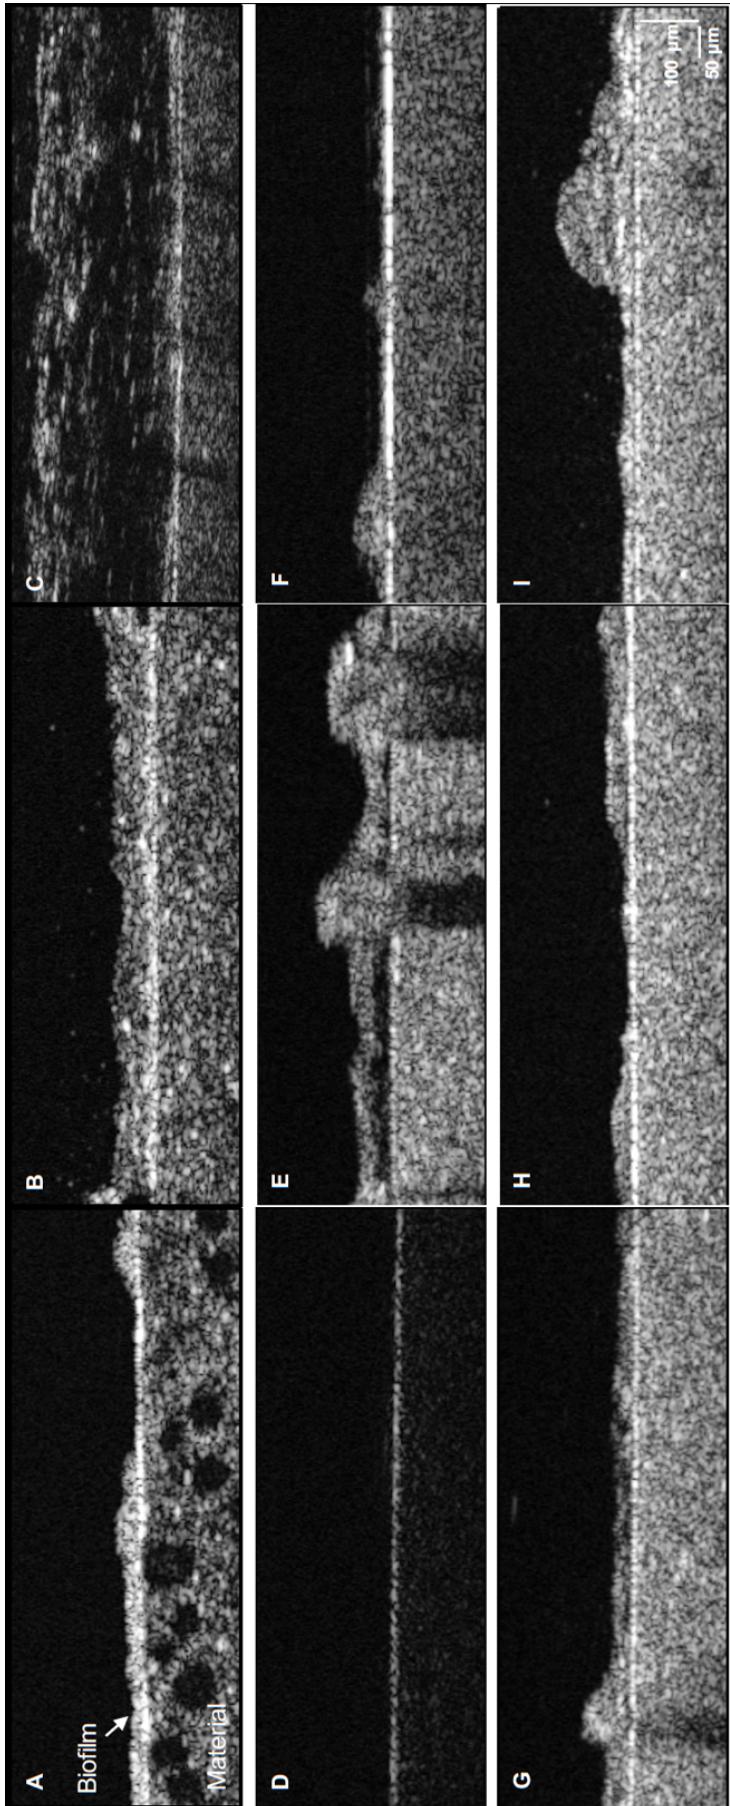

Figure S2: Optical coherence tomography (OCT) was used to image biofilm shape and thickness of selected bath toys. For real bath toys three exemplary biofilms are shown (A-C). Biofilms of clean water controls, which were used with water prior to bathing, are shown in D-F, while biofilms of dirty water controls, processed with water after bathing, are shown in images G-I.

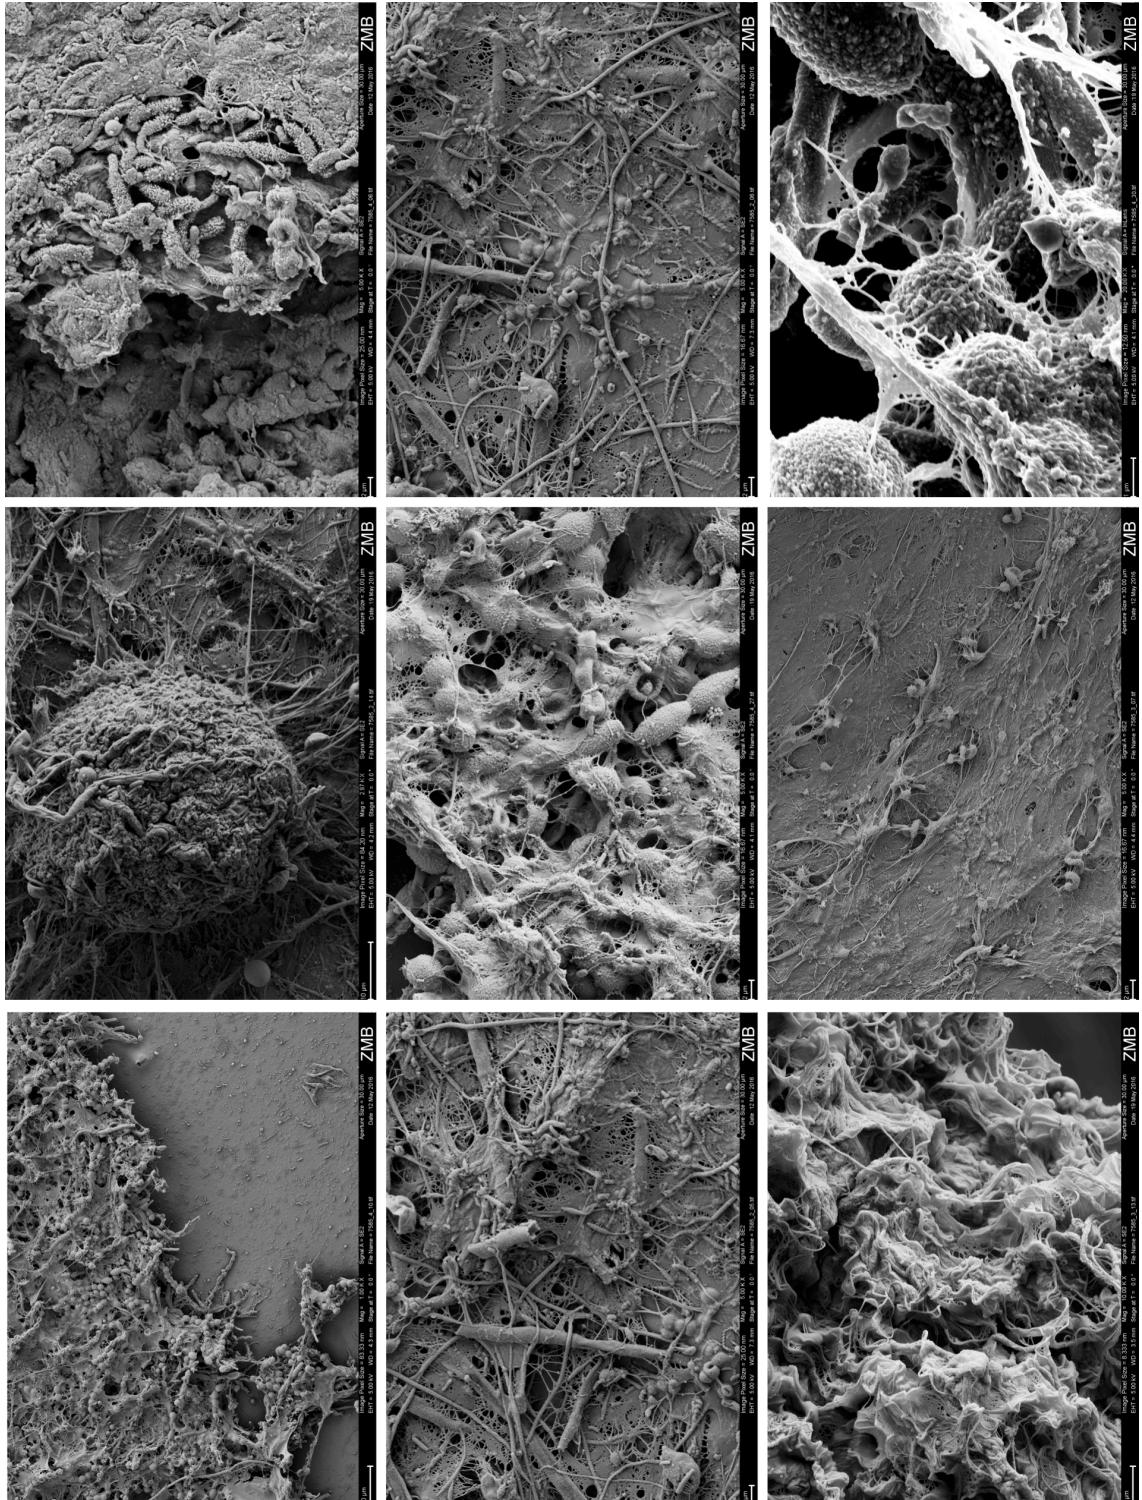

Figure S3: Additional images for biofilm composition by scanning electron microscopy. SEM was used to visualize the microbial community composition in some real bath toy biofilms. Images were taken by the Center for Microscopy and Image Analysis, University Zurich.

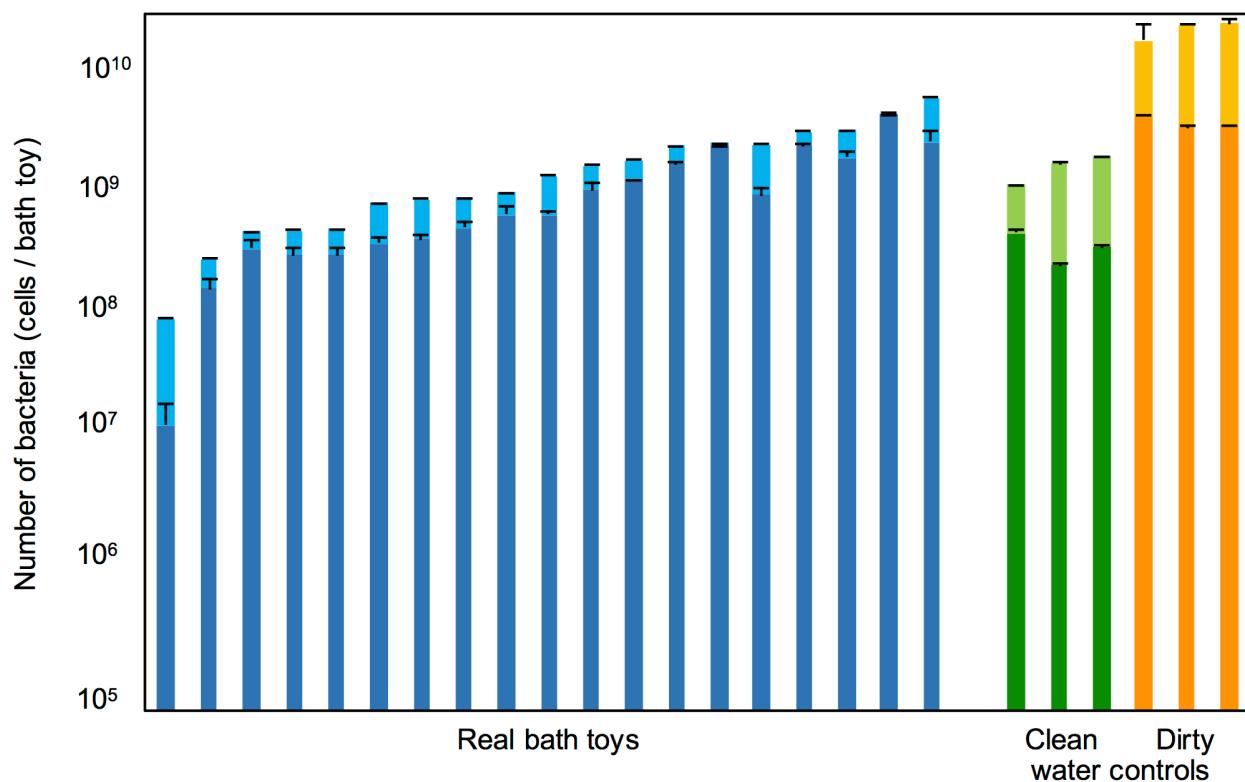

Figure S4: Number of bacteria in bath toy biofilms. Flow cytometry was used to differentiate between the total number of cells (SYBR® Green I staining) and the amount of intact cells (SYBR® Green I and Propidium Iodide staining) in biofilms grown in bath toys from real households or in control bath toys processed with either water prior (clean water controls) or after bathing (dirty water controls). The darker colours represent the number of intact bacteria in each bath toy, the lighter colours the damaged amount of the total number of cells. Error bars represent standard deviations of triplicate measurements.

Table S2: Classification of operational taxonomic units (OTUs) shared by biofilms originating from all bath toys (grey), all real bath toys (blue), all control bath toys (yellow), all clean water controls (green), or all dirty water controls (orange). NA indicates that no further classification could be made for that. “OTU-ID name” gives identity of clustered OTUs for comparison between categories.

Table S3: ‘Household-specific core communities’ in real bath toys originated from five different Swiss households, with bath toys provided ranging between 1 – 6 bath toys per household. The OTUs in each core community are (1) present in all samples from the household, and (2) not present in other households; while shared OTUs are (1) present in all samples from the household, but (2) not necessarily exclusively.

	n(bath toys) / household	Sum of reads	n(household specific core OTUs)	% of core-reads / total number of reads within household	n(shared OTUs) / household
Household_I	1	30'133	33	0.1	-
Household_II	2	60'266	1'289	2.9	1'445
Household_III	3	90'399	741	2.1	124
Household_IV	5	150'665	1'059	1.1	41
Household_V	6	180'798	3'904	4.2	29

Table S4: Number of operational taxonomic units (OTUs) per individual bath toy and Shannon-Wiener index (H') as a measure of diversity.

Bath toy	Number of observed OTUs	H'
Real bath toy 01	2'826	0.52
Real bath toy 02	239	0.31
Real bath toy 03	597	0.43
Real bath toy 04	3'199	0.62
Real bath toy 05	3'483	0.52
Real bath toy 06	2'458	0.47
Real bath toy 07	281	0.35
Real bath toy 08	192	0.27
Real bath toy 09	6'196	0.71
Real bath toy 10	3'562	0.57

Real bath toy 12	204	0.26
Real bath toy 13	329	0.39
Real bath toy 14	311	0.33
Real bath toy 15	No data available	
Real bath toy 16	335	0.33
Real bath toy 17	527	0.35
Real bath toy 18	No data available	
Real bath toy 19	435	0.32
Clean water control	214	0.26
Clean water control	188	0.23
Clean water control	265	0.17
Dirty water control	269	0.32
Dirty water control	268	0.25
Dirty water control	252	0.25

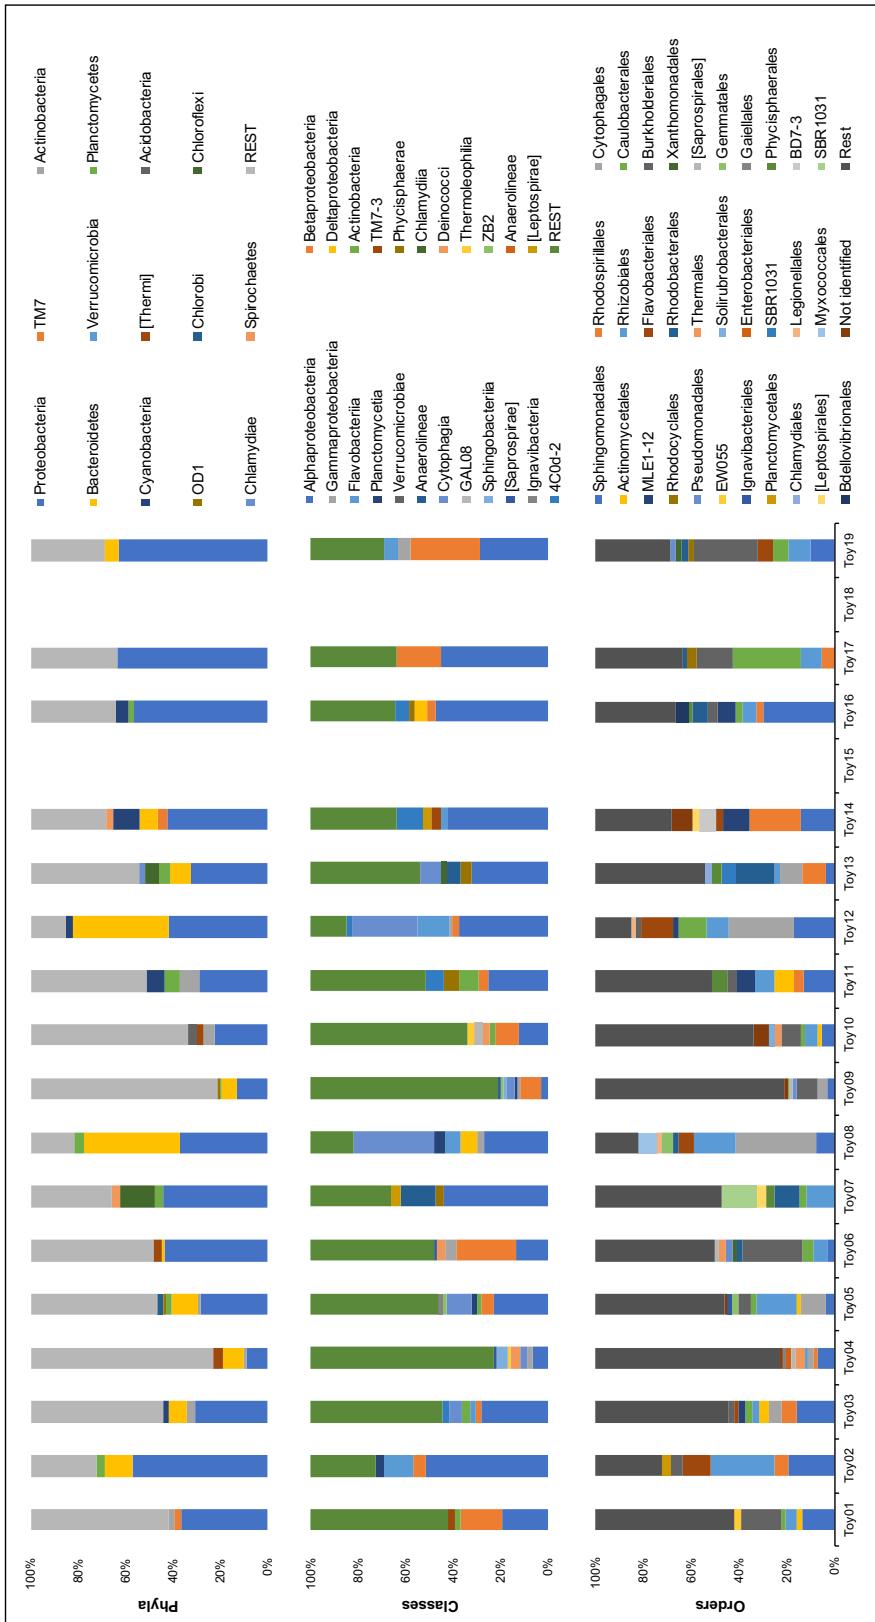

Figure S5: Classification of abundant OTUs in real bath toy biofilms. The ten most abundant OTUs for each single bath toy (i.e., OTUs with the most numbers of reads with all samples set to an even depth of 30'133 reads), originating from random households, were separated on different classification levels (phylum, class, order) to highlight differences in community compositions.

Table S5: Comparison of most abundant operational taxonomic units (OTUs) in control bath toy biofilms. Most abundant OTUs in clean and dirty water control biofilms are specified on different classification levels. Bold highlighted OTUs were dominant in both clean and dirty water controls.

		Phylum	Class	Order	Family	Genus
Clean water controls	Proteobacteria	Alphaproteobacteria	Caulobacterales	Caulobacteraceae	Caulobacter

Rest						

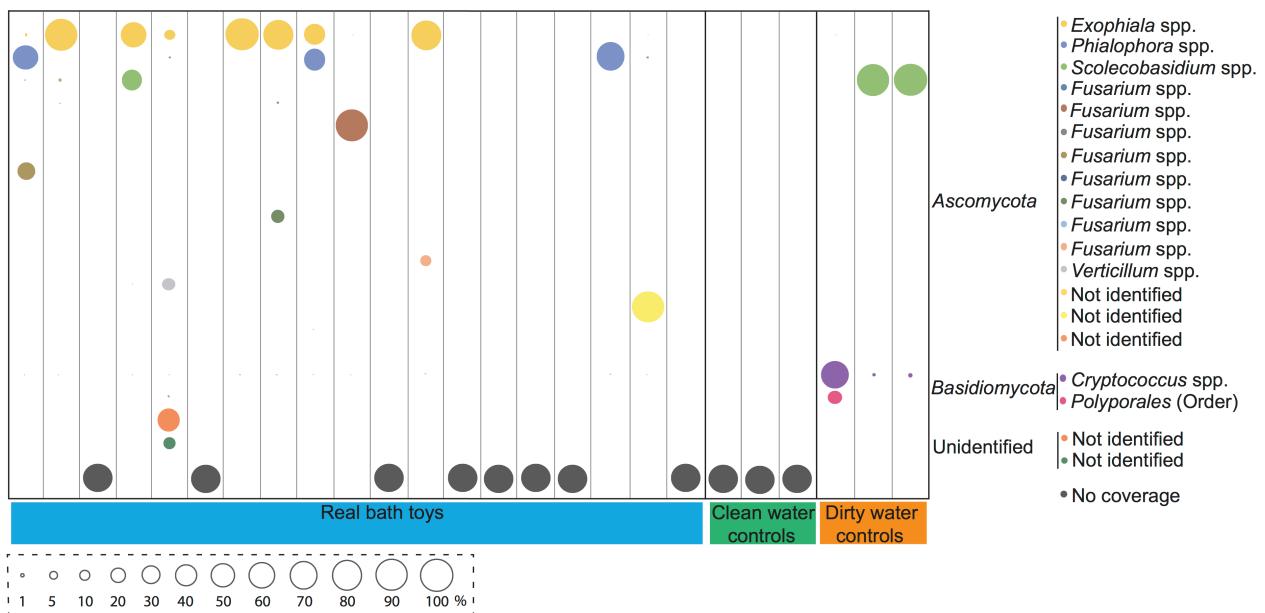

Figure S6: Dominant operational taxonomic units (OTUs) in fungal communities of bath toy biofilms. Colors represent different OTUs on genus level, with the majority belonging to the phylum Ascomycota and the rest either to Basidiomycota or being unidentified. Samples indicated with black circles did not show any results for fungi representatives. In general, the size of the circles indicates the absolute abundance of each OTU, with bigger volumes indicating higher percentages.

Table S6: Conventional plating results testing biofilms from the inner surface of bath toys for several indicator bacteria or groups. Samples were taken from either real bath toys (A) which were used randomly in different households or from control bath toys (B) which were used either with clean water prior to bathing (clean water controls) or with used water after bathing (dirty water controls). Compact Dry Plates were used for testing the presence of *Pseudomonas aeruginosa*, *Listeria* spp., *Enterococci* spp., Coliforms, and *Escherichia coli*. Special agar plates (Legionella BMP α Selective Medium) were used for the detection of *Legionella pneumophila*. Red, empty boxed indicate negative cultivation results. Green boxed indicate positive results including numbers of colony forming units (CFU). The number of CFUs was recalculated to their total presence per bath toy, with a detection limit of 3.3×10^2 CFU/bath toy.

A	Real bath toys																		
	<i>P. aeruginosa</i>	3×10^2		2×10^4		14×10^5		4×10^5		5×10^5	1×10^5	4×10^4		3×10^3	4×10^5	8×10^5	3×10^3		
<i>Listeria</i> spp.		3×10^3				1×10^5	2×10^4								4×10^2	4×10^5	5×10^3		
<i>Enterococci</i> spp.		1×10^3					3×10^2				3×10^2					1×10^5			
Coliforms																			
<i>E. coli</i>																			
<i>L. pneumophila</i>		7×10^4	7×10^4					4×10^4							1×10^5		2×10^6	7×10^3	
B	Clean water controls			Dirty water controls															
<i>P. aeruginosa</i>	2×10^4	1×10^4	1×10^3	3×10^4	8×10^4	3×10^4													
<i>Listeria</i> spp.	8×10^3	1×10^3	1×10^3	4×10^4	6×10^4	1×10^5													
<i>Enterococci</i> spp.																			
Coliforms	3×10^3	2×10^4																	
<i>E. coli</i>					4×10^4	1×10^5	1×10^5												
<i>L. pneumophila</i>	1×10^4			7×10^3	2×10^3	2×10^3	2×10^3												

Table S7: Carbon migration potential (MP) and biomass formation potential (BFP) of the control bath toys' plastic material. Carbon migration was measured after 1 (M1), 3 (M3), and 7 (M7) days of incubation (with water renewal on day 2, 4, 5, and 6 without measurement) and values for total organic carbon (TOC), total cell counts/cm² (TCC), as well as the proportion of assimilable organic carbon (AOC) to total organic carbon were summarized afterwards ($\sum_{M1/M3/M7}$). Standard deviations are given for experimental triplicates (Stdev). For the BFP, planktonic (pBFP) and biofilm (bBFP) growth after 14 d of incubation was measured.

Carbon migration	TOC [µg/cm ²]	TOC [µg/cm ² /day]	TCC [cells/cm ²]	AOC/TOC [%]
$\sum_{M1/M3/M7}$	11.8	-	8.7×10^7	73.5
Stdev	0.8	-	1.1×10^6	-
M1	-	5.59		
Stdev	-	0.07		
M3	-	3.59		
Stdev	-	0.62		
M7	-	2.59		
Stdev	-	0.12		
Biofilm formation	Planktonic cells/cm ²	Biofilm cells/cm ²	\sum BFP [cells/cm ²]	pBFP/bBFP [%]
t ₁₄	3.0×10^8	3.6×10^8	6.6×10^8	82.5
Stdev	5.1×10^7	5.6×10^7	1.1×10^8	-

Characteristics of tap water in the control experiment prior to and after bathing

Method

Water samples were taken before and after bathing in the control experiment. Total cell numbers were analyzed (FCM, SG staining; see above) and the concentrations of dissolved organic carbon (DOC), total organic carbon (TOC), total nitrogen (TN), and total phosphorus (TP) were measured. Chemical measurements were performed in a TOC-L_{CSH} (SHIMADZU GmbH, Switzerland) where carbon dioxide (CO₂) was measured with an infrared (IR) detector after an initial catalytically burning at 720 °C. For differentiating between total and dissolved organic carbon, DOC samples were filtered (0.45 µm) before separate measurement. For the T-N measurement, NO_x was measured with a chemiluminescence detector.

Results

Table S8: Biological and chemical parameters for water before and after bathing. Total cell numbers per milliliter as well as concentrations for dissolved organic carbon (mg DOC/L), total organic carbon (mg TOC/L), total nitrogen (mg TN/L), and total phosphate (µg TP/L) were measured for clean water prior to bathing and dirty water after bathing including dirt and soap. Standard deviations (Stdev) are given for the measurement of three individual samples.

	DOC [mg/L]	TOC [mg/L]	TN [mg/L]	TP [µg/L]	TCC / mL
Before bathing	1.0	1.2	2.6	13.7	2.1×10^5
	Stdev	0.1	0.1	0.3	1.1×10^5
After bathing	11.3	15.7	4.9	21.2	4.1×10^5
	Stdev	1.6	1.2	1.0	2.5×10^5

Table S9: Settings for Amplicon PCR and Index PCR.

Amplicon PCR	Temperature	Duration	Cycles
	95°C	5:00 min	29 x
	95°C	0:20 min	
	51°C	0:15 min	
	72°C	0:30 min	
	4°C	hold	
Index PCR	Temperature	Duration	Cycles
	95°C	3:00 min	8 x
	95°C	0:30 min	
	51°C	0:35 min	
	72°C	0:35 min	
	4°C	hold
