

Supplemental Fig. S1. The combination index of baicalein and docetaxel for cell viability in 8505c cells. The combination index was calculated from the Bliss independence model described by the equation $CI = (E_A + E_B - [E_A \times E_B]) / E_{AB}$, where CI is the combination index, E_A is the effect of drug A (baicalein), E_B is the effect of drug B (docetaxel), and E_{AB} is the combined effect of A and B at 24 hours (A) and 48 hours (B). ^a $P < 0.05$; ^b $P < 0.01$ vs. baicalein (20 μM) and docetaxel (2 nM).
