Jennifer Graves, MD, PhD (Department of Neurology, University of California, San Francisco, Center Co-Director), Tanuja Chitnis, MD (Partners Pediatric Multiple Sclerosis Center, Massachusetts General Hospital for Children, Center Director), Amy Waldman, MD (Department of Neurology, University of Pennsylvania, Site Investigator), Timothy Loetze, MD (Blue Bird Circle Multiple Sclerosis Center, Baylor College of Medicine, Center Director), Teri Schreiner, MD (Children's Hospital Colorado, University of Colorado, Center Director), Anita Belman, MD (Lourie Center for Pediatric MS, Stony Brook Children's Hospital, Site Investigator), Benjamin Greenberg, MD (Department of Neurology, UT Southwestern, Site Investigator), Bianca Weinstock-Guttman, MD (Pediatric Multiple Sclerosis Center, Jacobs Neurological Institute, Center Director), Gregory Aaen, MD (Pediatric MS Center at Loma Linda University Children's Hospital, Center Director), Jan M Tillema, MD (Mayo Clinic's Pediatric MS Center, Center Director), Janace Hart, BA (University of California, San Francisco, Regional Pediatric MS Center, Center Coordinator), Stacy Caillier, BS (University of California, San Francisco, Regional Pediatric MS Center, Center Coordinator), Jayne Ness, MD (University of Alabama Center for Pediatric-onset Demyelinating Disease, Children's Hospital of Alabama, Center Director), Yolanda Harris, NP (University of Alabama Center for Pediatric-onset Demyelinating Disease, Children's Hospital of Alabama, Site Coordinator), Jennifer Rubin, MD (Department of Pediatric Neurology, Northwestern Feinberg School of Medicine, Site Investigator), Meghan Candee, MD (University of Utah, Primary Children's Hospital, Site Investigator), Lauren Krupp, MD (Lourie Center for Pediatric MS, Stony Brook Children's Hospital, Center Director), Mark Gorman, MD (Boston Children's Hospital, Center Director), Leslie Benson, MD (Boston Children's Hospital, Center Co-Director), Moses Rodriguez, MD (Mayo Clinic's Pediatric MS Center, Center Director), Soe Mar, MD (Pediatric-onset Demyelinating Diseases and Autoimmune Encephalitis Center St. Louis Children's Hospital, Washington University School of Medicine, Center Director), Ilana Kahn, MD (Children's National Medical Center, Site Investigator), John Rose, MD (Department of Neurology, University of Utah School of Medicine, Data Collection and Analysis Center, Co-PI), Shelly Roalstad, MSc, BS (Department of Pediatrics, University of Utah School of Medicine, Data Coordinating and Analysis Center, Program Director), T. Charles Casper, PhD (Department of Pediatrics, University of Utah School of Medicine, Data Coordinating and Analysis Center, Co-PI), Emmanuelle Waubant, MD, PhD (Department of Neurology, University of California, Center Director)

## Appendix 2

### U.S. Participants

Pediatric onset MS cases were enrolled through pediatric MS centers established across the U.S. at UC San Francisco (UCSF), Stony Brook, Children's Hospital of Philadelphia, Texas Children's Hospital, University of Colorado School of Medicine, University of Texas Southwestern, State University of New York Buffalo, Loma Linda University, Mayo Clinic, University of Alabama at Birmingham, Ann & Robert Lurie Children's Hospital of Chicago, University of Utah, Boston Children's Hospital, Massachusetts General Hospital, Washington University St. Louis, and Children's National Medical Center between January 2006 and December 2014. These centers are tertiary referral centers, but also serve local patients from all socioeconomic groups. A separate cohort of distinct cases were enrolled in a NIH supported case-control study (R01 NS071463, PI Waubant) with MS onset before the age of 18, seen within 4 years of disease onset, with at least 2 silent T2-bright foci on brain and cord MRI, and ascertained by a panel of at least two pediatric MS experts. Additional pediatric onset PO-MS cases were also provided from an MS genetic study at UCSF who had a first symptom onset prior to age 18 based on medical records. All clinically isolated syndrome cases were excluded from this study.

### Whole Genome Genotyping

Whole blood was collected, processed and extracted for DNA using the Gentra Puregene protocol or received as Guthrie Card blood samples and extracted for DNA using the QIAamp DNA Micro Kit for Dried Blood Spots. Saliva was collected for DNA extraction using Oragene kits. Genome wide profiling was performed for all cases and a subset of controls ( $n=1,481$ ) using the Illumina Infinium platform. The Infinium 660K, HumanOmniExpress, or HumanOmniExpressExome BeadChip was used to genotype each study participant. DNA was quantitated using the Nanodrop ND-1000, normalized and then plated for BeadChip processing. The RPGEH control group was genotyped using a custom designed Affymetrix Axiom array for individuals of non-Hispanic white (EUR) race/ethnicity with 670,176 single nucleotide polymorphisms (SNPs). High genome-wide SNP imputation coverage of these arrays including low frequency variants has been previously described.<sup>1,2</sup>

### Strand Alignment and Pre-Imputation Quality Control

Prior to phasing, the genetic map of Affymetrix chips and 660K chip were updated to build 37 using LiftOver.<sup>3</sup> Sample genotype alleles were aligned to the reference haplotype panel. Samples from the Illumina arrays were converted from Illumina's TOP format to '+' format<sup>4</sup> using script and strand files from the Wellcome Trust Centre for Human Genetics. Strand alignment for all chips was verified using SHAPEIT; misaligned SNPs were removed. All samples from Illumina OmniExpress and OmniExpressExome chips were merged for further analysis. Quality control was completed on each of the three platforms separately for phasing and imputation. We removed SNPs with minor allele frequency (MAF)  $<0.01$  and genotyping rate  $<90\%$  ( $n=222,801$ ). After removing low quality SNPs, PLINK<sup>5</sup> was used to check sample call-rate ( $n=2$  with  $<90\%$ ) and sex discrepancies ( $n=5$ ).

### Phasing and Imputation

Samples from all genotyping arrays were phased and imputed separately. Samples were pre-

phased using SHAPEIT (v2.r790) and imputed using IMPUTE2 (total n=~81 million imputed SNPs for each array). Genotype imputation was performed using IMPUTE2 and the 1,000 Genomes Phase 3 reference haplotypes, based on sequence data from 2,504 individuals.<sup>6</sup> Files from the IMPUTE2 October 2014 haplotype release were downloaded ([https://mathgen.stats.ox.ac.uk/impute/1000GP\\_Phase3.html](https://mathgen.stats.ox.ac.uk/impute/1000GP_Phase3.html)). The reference panel includes ~81 million SNPs. After imputation, only SNPs with a high imputation quality score (IMPUTE2 info score  $\geq 0.3$ ) were retained for analysis (n=26,431,554 SNPs among the three platforms).

### **Population Substructure**

Classical multidimensional scaling (MDS) was performed to visualize population substructure and provide quantitative measures (components) of population genetic variation. MDS was completed for all genotyped data, which was merged with the Human Genome Diversity Project (HGDP) reference (<http://www.hagsc.org/hgdp/files.html>). SNPs present in <90% were removed. Whole genome data was pruned using a window of 100 SNPs. Linkage disequilibrium was calculated between each pair of SNPs in the window. If linkage disequilibrium between two SNPs ( $R^2$ ) was  $> 0.1$ , one of the SNPs was removed. Analysis of genome-wide average proportion of alleles shared identical by state was performed, and related/identical individuals were removed. The first three dimensions from MDS with the HGDP European population were used for identifying white, non-Hispanic study samples for the current study. Individual outliers were identified using MDS and excluded.

### **MHC Quality Control**

A total of 98,510 SNPs in the MHC had an info score  $\geq 0.3$  after imputation. Due to a high potential for the imputation results to be biased when imputing from multiple genotyping arrays, we used precautions to eliminate SNPs most likely to be biased from analysis. First, white controls were selected from the three platforms for comparison (660K vs. OMNI; OMNI vs. Affymetrix EUR; 660K vs. Affymetrix EUR). For each of these comparisons, we conducted pairwise analyses in three ways: 1) unmatched and unadjusted; 2) matched on MDS; and 3) unmatched but adjusting for the first three components of MDS. SNPs identified ( $p<0.05$ ) from the union of the above three control comparisons were excluded (n=27,478). Second, because imputation of rare alleles is less reliable, we removed 16,262 SNPs with a MAF <1%. Finally, we removed 33,357 SNPs that were successfully imputed in fewer than 99% of individuals, and 210 SNPs found to be out of Hardy-Weinberg equilibrium (HWE) in controls ( $p<0.000001$ ). A total of 21,203 SNPs remained for MHC region analysis. We additionally calculated HWE for each imputed SNP with info  $\geq 0.3$  by platform using post-MDS controls only. SNPs with HWE p-value  $< 0.000001$  in any of the three platforms were also excluded (N=6,989). Final analysis of the MHC included 14,214 SNPs.

### **Swedish Genotyping and Quality Control**

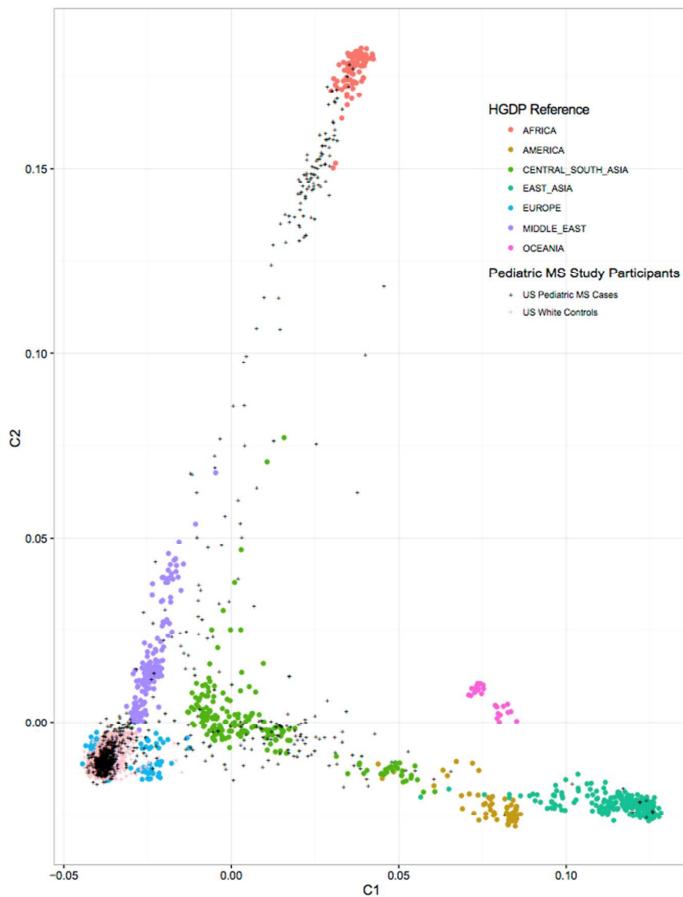

All participants were asked to give blood samples, which were genotyped on an Illumina custom array and on OmniExpress-24. [HLA genotypes, including HLA-DRB1 and HLA-A, genotypes](#) were imputed with HLA\*IMP02<sup>7</sup> using MHC region data for each individual from the custom array. SNPs with <2% MAF, genotyped in <98% of individuals, or not in HWE among controls ( $p<0.0001$ ) were removed from analysis. Individuals with >2% failed genotype calls, related individuals, or population outliers identified using the SmartPCA program were removed.<sup>8</sup> Ninety of the MS risk SNPs were present on the custom array. Proxy SNPs for an additional

eighteen MS risk SNPs were selected from the custom array ( $R^2 > 0.8$ , except rs28723576, which had  $R^2 > 0.71$ ).

**Supplementary Figure 1. Multidimensional scaling analysis of all U.S. pediatric-onset POMS cases (n=714) and U.S. white controls (n=10,875).**

U.S. pediatric-onset POMS cases included 394 white, 12 African, 9 East Asian, 20 Central South Asian, 5 American, and 274 admixed individuals. Human Genome Diversity Project (HGDP) data (N=897) were merged with case and control data. Black + are color coded for cases and yellow + for controls in study participants. Circles are color coded for HGDP sample origin.

**TABLE 1. STREGA reporting recommendations, extended from STROBE Statement**

Item	Item number	STROBE Guideline	Extension for Genetic Association Studies (STREGA)
<b>Title and Abstract</b>	1	(a) Indicate the study's design with a commonly used term in the title or the abstract. <b>Page 1, 4</b>  (b) Provide in the abstract an informative and balanced summary of what was done and what was found. <b>Page 4</b>	
<b>Introduction</b>			
<i>Background rationale</i>	2	Explain the scientific background and rationale for the investigation being reported. <b>Page 6</b>	
<b>Objectives</b>			
	3	State specific objectives, including any pre-specified hypotheses.  <b>Page 6</b>	<i>State if the study is the first report of a genetic association, a replication effort, or both.</i>
<b>Methods</b>			
<i>Study design</i>	4	Present key elements of study design early in the paper.  <b>Pages 7-8</b>	
<i>Setting</i>			
	5	Describe the setting, locations and relevant dates, including periods of recruitment, exposure, follow-up, and data collection. <b>Pages 7-8</b>	

Item	Item number	STROBE Guideline	Extension for Genetic Association Studies (STREGA)
<b>Appendix</b>			
<i>Participants</i>	6	<p>(a) <b>Cohort study</b> – Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up.</p> <p><b>Case-control study</b> – Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls. <a href="#">Pages 7-8; Appendix</a></p> <p><b>Cross-sectional study</b> – Give the eligibility criteria, and the sources and methods of selection of participants.</p>	<i>Give information on the criteria and methods for selection of subsets of participants from a larger study, when relevant.</i>
<i>Variables</i>	7	<p>(a) <b>Cohort study</b> – For matched studies, give matching criteria and number of exposed and unexposed.</p> <p><b>Case-control study</b> – For matched studies, give matching criteria and the number of controls per case.</p> <p><a href="#">Pages 7-10; Appendix</a></p>	<p>(b) <i>Clearly define genetic exposures (genetic variants) using a widely-used nomenclature system. Identify variables likely to be associated with population stratification (confounding by ethnic origin).</i></p>

Item	Item number	STROBE Guideline	Extension for Genetic Association Studies (STREGA)
<i>Data sources measurement</i>	8*	<p>(a) For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group.</p> <p><b>Pages 7-10; Appendix</b></p>	<p><b>(b) Describe laboratory methods, including source and storage of DNA, genotyping methods and platforms (including the allele calling algorithm used, and its version), error rates and call rates. State the laboratory/centre where genotyping was done. Describe comparability of laboratory methods if there is more than one group. Specify whether genotypes were assigned using all of the data from the study simultaneously or in smaller batches.</b></p>
<i>Bias</i>	9	<p>(a) Describe any efforts to address potential sources of bias.</p> <p><b>Pages 9-10; Appendix</b></p>	<p><b>(b) For quantitative outcome variables, specify if any investigation of potential bias resulting from pharmacotherapy was undertaken. If relevant, describe the nature and magnitude of the potential bias, and explain what approach was used to deal</b></p>

Item	Item number	STROBE Guideline	Extension for Genetic Association Studies (STREGA)
<i>with this.</i>			
<i>Study size</i>	10	Explain how the study size was arrived at. <b>Page 13</b>	
<i>Quantitative variables</i>	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen, and why.  <b>Pages 7-10; Appendix</b>	<b>If applicable, describe how effects of treatment were dealt with.</b>
<i>Statistical methods</i>	12	(a) Describe all statistical methods, including those used to control for confounding. <b>Pages 9-10; Appendix</b>  (b) Describe any methods used to examine subgroups and interactions.  <b>Pages 9-10</b>  (c) Explain how missing data were addressed.  <b>Pages 9-10; Appendix</b>	<b>State software version used and options (or settings) chosen.</b>

Item	Item number	STROBE Guideline	Extension for Genetic Association Studies (STREGA)
		<p>(d) <b>Cohort study</b> – If applicable, explain how loss to follow-up was addressed.</p> <p><b>Case-control study</b> – If applicable, explain how matching of cases and controls was addressed. <b>Pages 10-11</b></p> <p><b>Cross-sectional study</b> – If applicable, describe analytical methods taking account of sampling strategy.</p>	
		(e) Describe any sensitivity analyses.	
		<b>Pages 7-10; Appendix</b>	<i>(f) State whether Hardy-Weinberg equilibrium was considered and, if so, how.</i>
		<b>Page 9; Appendix</b>	<i>(g) Describe any methods used for inferring genotypes or haplotypes.</i>
		<b>Pages 9-10; Appendix</b>	<i>(h) Describe any methods used to assess or address population stratification.</i>
		<b>Page 10</b>	<i>(i) Describe any methods used to address multiple comparisons or to control risk of false positive findings.</i>

Item	Item number	STROBE Guideline	Extension for Genetic Association Studies (STREGA)
		<b>Appendix</b>	<i>(j) Describe any methods used to address and correct for relatedness among subjects</i>
<b>Results</b>			
<i>Participants</i>	13*	<p>(a) Report the numbers of individuals at each stage of the study – e.g., numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed.</p> <p><b>Pages 7-10; Appendix</b></p> <hr/> <p>(b) Give reasons for non-participation at each stage.</p> <hr/> <p>(c) Consider use of a flow diagram.</p>	<i>Report numbers of individuals in whom genotyping was attempted and numbers of individuals in whom genotyping was successful.</i>
<i>Descriptive data</i>	14*	<p>(a) Give characteristics of study participants (e.g., demographic, clinical, social) and information on exposures and potential confounders.</p> <p><b>Table 1, Pages 10-11</b></p> <hr/> <p>(b) Indicate the number of participants with missing data for each variable of interest.</p>	<i>Consider giving information by genotype.</i>

Item	Item number	STROBE Guideline	Extension for Genetic Association Studies (STREGA)
(c) <b>Cohort study</b> – Summarize follow-up time, e.g. average and total amount.			
<i>Outcome data</i>	15 *	<b>Cohort study</b> -Report numbers of outcome events or summary measures over time.	<b>Report outcomes (phenotypes) for each genotype category over time</b>
		<b>Case-control study</b> – Report numbers in each exposure category, or summary measures of exposure.	<b>Report numbers in each genotype category</b>
		<b>Cross-sectional study</b> – Report numbers of outcome events or summary measures.	<b>Report outcomes (phenotypes) for each genotype category</b>
<i>Main results</i>	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (e.g., 95% confidence intervals). Make clear which confounders were adjusted for and why they were included. <b>Pages 10-13</b>	

Item	Item number	STROBE Guideline	Extension for Genetic Association Studies (STREGA)
		(b) Report category boundaries when continuous variables were categorized.	
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period.	
		<b>Pages 15; Table 3</b>	<b><i>(d) Report results of any adjustments for multiple comparisons.</i></b>
Other analyses	17	(a) Report other analyses done – e.g., analyses of subgroups and interactions, and sensitivity analyses. <b>Page 14</b>	
		<b>Pages 11-12</b>	<b><i>(b) If numerous genetic exposures (genetic variants) were examined, summarize results from all analyses undertaken.</i></b>
		<b>Pages 11-12 (mentions supplemental data)</b>	<b><i>(c) If detailed results are available elsewhere, state how they can be accessed.</i></b>
<b>Discussion</b>			

Item	Item number	STROBE Guideline	Extension for Genetic Association Studies (STREGA)
<i>Key results</i>	18	Summarize key results with reference to study objectives. <b>Pages 12-13</b>	
<i>Limitations</i>	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias. <b>Pages 15-16</b>	
<i>Interpretation</i>	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence. <b>Pages 15-16</b>	
<i>Generalizability</i>	21	Discuss the generalizability (external validity) of the study results. <b>Pages 15-16</b>	
<b>Other Information</b>			
<i>Funding</i>	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based. <b>Page 23</b>	

STREGA = STrengthening the REporting of Genetic Association studies; STROBE = STrengthening the Reporting of Observational Studies in Epidemiology.

\* Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.
