

Supplementary Figure 5:

Effect of simulated ischemia/reperfusion injury on cell survival and effect of vehicle

Effect of 4 hours simulated ischemia followed by 2 hours of simulated reperfusion on cardiac myocyte cell viability in comparison to 4 hours normoxia followed by 2 hours of simulated reperfusion. Effect of 0,1% DMSO (vehicle) on cell viability. Data are expressed in the ratio of normoxic group in percent. * $p < 0.05$, (One-way ANOVA followed by Dunnett post hoc test).
