

Effect of positive control ilomastat on cell survival

Effect of MMPis Ilomastate (at 0,5 uM concentration) on cardiac myocyte cell viability after 4 hours normoxia followed by 2 hours of simulated reperfusion. Data are expressed in the ratio of vehicle (DMSO) control in percent. * $p < 0.05$ vs. Vehicle, $n = 5-6$ (One-way ANOVA followed by Dunnett post hoc test).
