Data represent dietary recording of metabolic syndrome subjects, in the autologous and vegan FMT group, both before and after treatment. Data are depicted as means + SDs. A p-value < 0.05 was considered significant. FMT = fecal microbiota transplantation

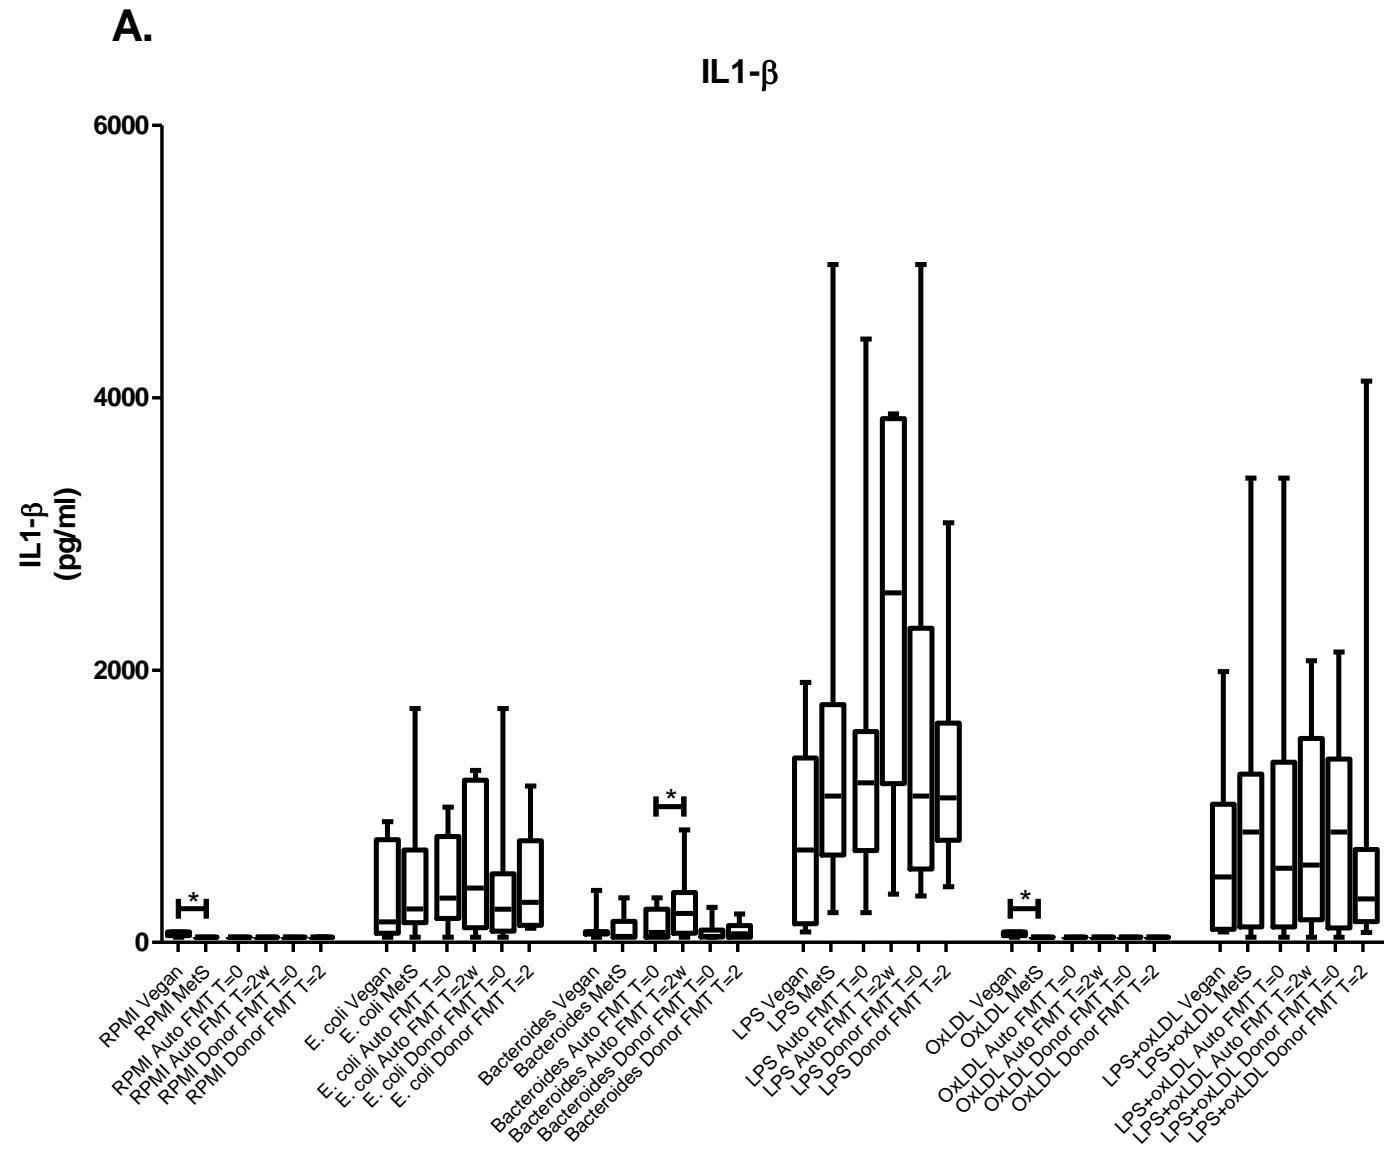

**Figure S1. D6-choline plasma and urine metabolites.**

Graphs showing the 24-hour appearance of d6-choline in plasma (A), the 24-hour appearance of d6-TMAO (from d6-choline) in plasma (B) and the total urinary excretion of d6-TMAO and d6-TMA in the 24 hours following oral ingestion of 250mg d6-labeled choline (C-D). Data are depicted as box-and-whisker plots. No significant differences were found. Auto FMT = autologous fecal microbiota transplantation; Donor FMT = lean vegan donor fecal microbiota transplantation; iAUC = incremental area under the curve; MetS = obese omnivorous metabolic syndrome patients; TMA = trimethylamine; TMAO = trimethylamine-N-oxide; Vegans = lean vegan FMT donors

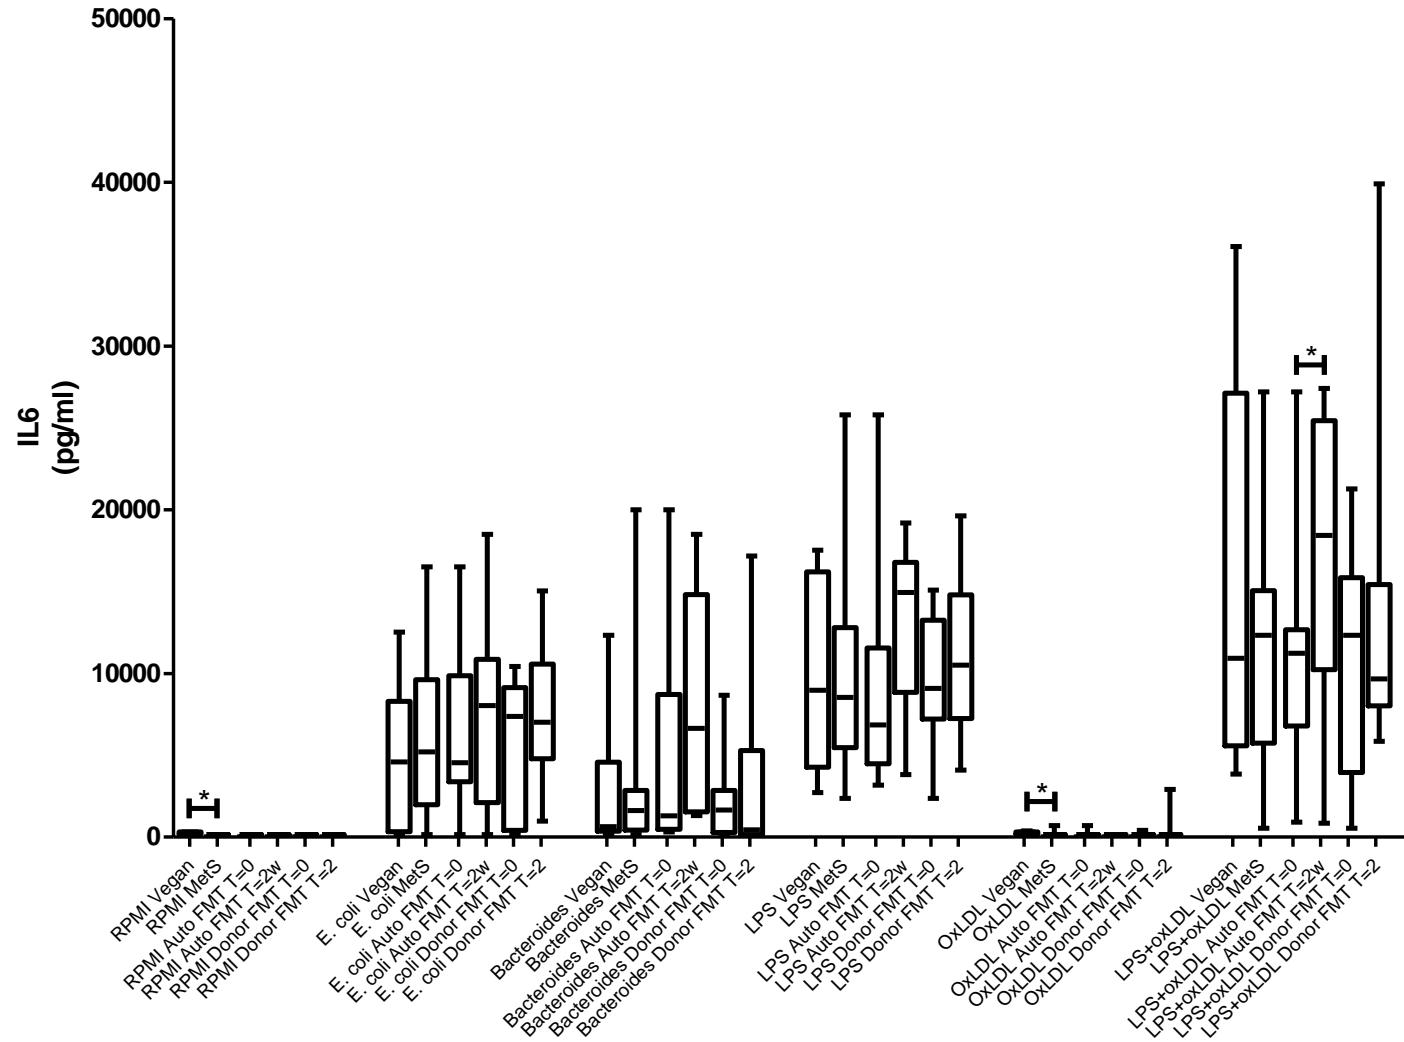

**Figure S2A-D. Monocyte cytokine production after lean vegan donor or autologous FMT.**

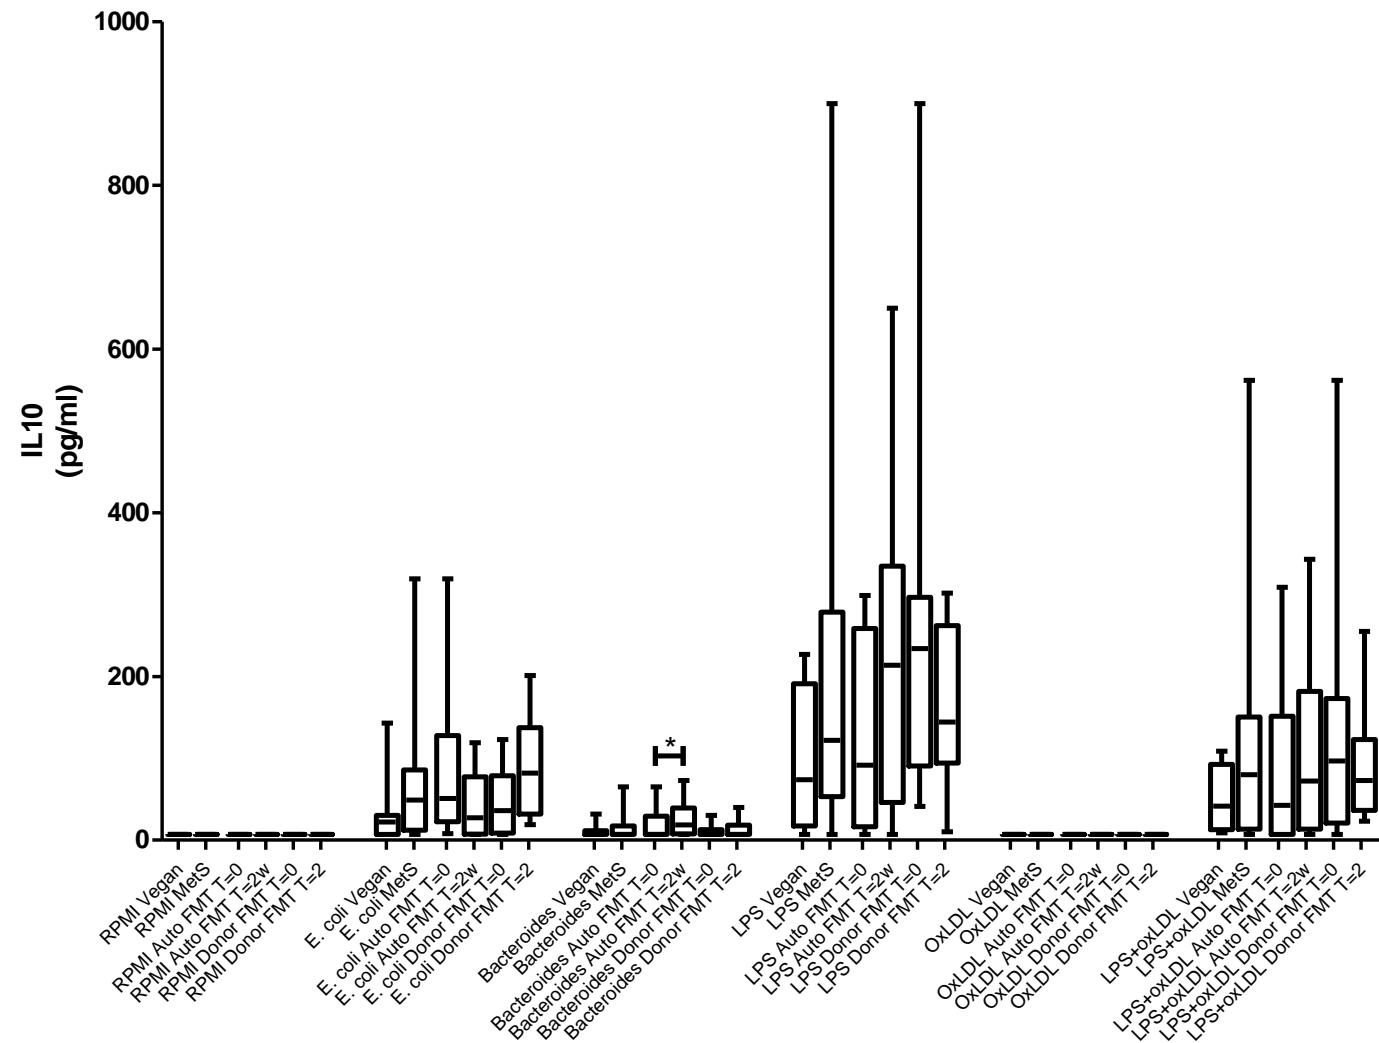

Depicted is the ex vivo monocyte production of 4 different cytokines (A: IL1- $\beta$ ; B: IL6; C: IL10; D: TNF- $\alpha$ ), after in total 6 stimuli of which RPMI served as the control stimulus. Data are depicted as box-and-whisker plots. A p-value < 0.05 was considered significant and is marked with an asterisk. Auto = autologous fecal microbiota transplantation; Allo = lean vegan donor fecal microbiota transplantation; e. coli = Escherichia coli; IL = interleukin; LPS = lipopolysaccharide; oxLDL = oxidized low-density lipoprotein; RPMI = Roswell Park Memorial Institute medium; TNF $\alpha$  = tumor-necrosis factor  $\alpha$
