

Figure S1: Observed plasma concentration versus (hours) (A: normal scale, B: log-normal scale). Time after dose could be up to 60 hours as some patients only received benzylpenicillin for 2 days, after which it was discontinued while samples were still drawn according to protocol on following study days.

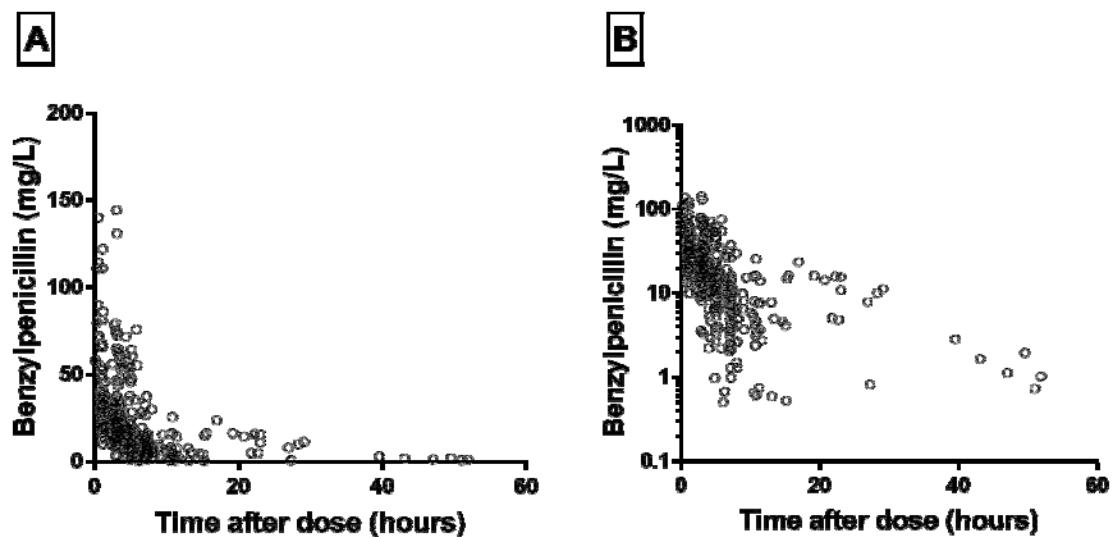

Figure S2: Visual predictive check of the system-specific model (A) and the reference-model (B) with observed benzylpenicillin concentrations (blue circles) and population prediction (red solid line) with the corresponding 95% prediction interval (dotted red lines). Pink and blue fields represent the model-based percentile confidence interval.

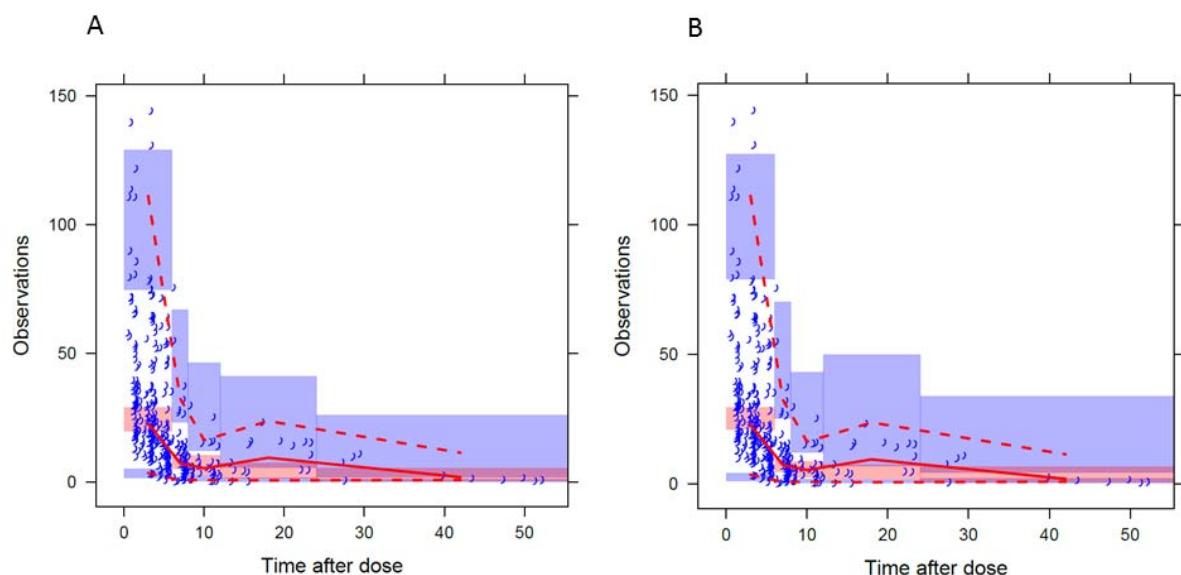

Figure S3: individual post hoc benzylpenicillin clearances ( $\text{Cl}$ , red circle) and population predicted benzylpenicillin clearances (TVCL; black triangle) versus the most predictive covariate (postnatal age, PNA) for the system-specific model (A) and the reference-model (B).

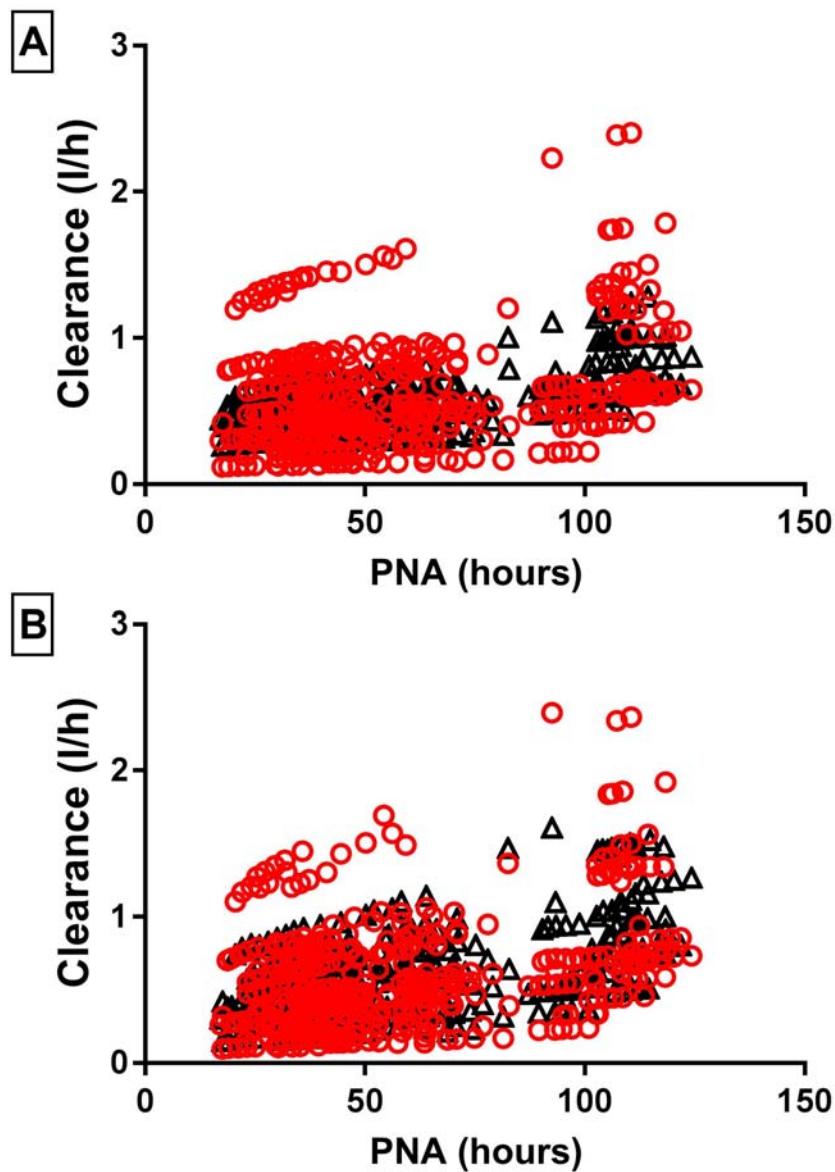

Table S1: Simulated trough and peak concentrations based on the system-specific model.

Dosage regimen	GA	UO	Level	Median concentration (mg/L)	5 <sup>th</sup> percentile (mg/L)	95 <sup>th</sup> percentile (mg/L)
75,000 IU/kg/day in 3 doses	36	0.5	T	7.6	1.3	22.5
			P	25.8	12.5	50.0
		2	T	6.3	1.0	19.6
