

Supplementary Figure S5. GABA_A antagonist stimulus one week post infection on mosquito neuron cultures. (A) Bar plots representing the average proportion of Active Electrodes (AE) and Bursting electrodes (BE) per MEA for each group after introduction of the solvent (TC-water) and gabazine stimulus. (B) Line charts representing the average relative change of the mean spike number per electrode between the reference (TC-water) and the introduction of gabazine at different time points. All data points show mean value with \pm SEM and statistical tests *p*-value are indicated on top of data points when significant.
