

Figure S2. Shoot lengths of 26 IK-CSSLs, IR64, and Kinandang Patong (KP) grown in hydroponic conditions. Values are means \pm SD ($n = 24$). Black and gray bars indicate lines with longer and shorter roots than those of IR64, respectively ($p < 0.001$, Dunnett's test). Dashed lines show the mean values of IR64. Substituted chromosome in each line is indicated at the bottom. **(A)** 1st trial (data at 9 days after germination). **(B)** 2nd trial (data at 8 days after germination).
