<sup>a</sup> $\Delta\text{HC}$  is the difference between Lights OFF and Lights ON Precursor VOC mixing ratios from Table 1.

<sup>b</sup>Gas-Phase OC is the difference between  $\Delta\text{HC}$  and Particle OC not including any residual precursor VOC.

<sup>c</sup> $\Delta\text{H}_{\text{eff}}$  are the effective enthalpies of vaporization for the chamber-generated SOA. For more information, please consult: Offenberg, J. H.; Kleindienst, T. E.; Jaoui, M.; Lewandowski, M.; Edney, E. O., Thermal properties of secondary organic aerosols. *Geophysical Research Letters* **2006**, *33* (3).

<sup>d</sup>Experiment numbers are provided for internal reference.

<sup>a</sup>Correlations (Pearson's *r*) were the square root of the *r*<sup>2</sup> values determined by pair-wise comparisons of the mutagenic potencies of the atmospheres using the potency values from Table 1 expressed as rev m<sup>3</sup> mgC<sup>-1</sup> h<sup>-1</sup>. Values in **bold** are >0.05, indicating no significant difference between the mutagenic potencies of those two atmospheres with *P* < 0.05.

<sup>a</sup>Three plates were used for DMSO (0 h) controls, and two plates were used for all other exposures.

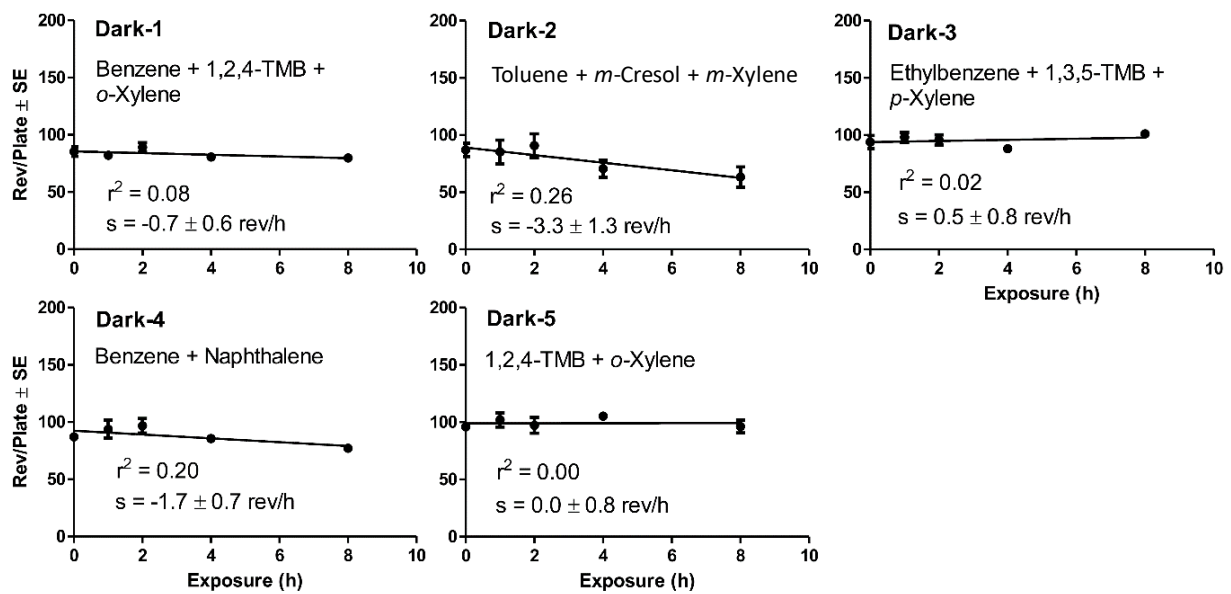

<sup>b</sup>Positive control at 3 µg/plate.

<sup>c</sup>Data not used in the linear regression because the R<sup>2</sup> value was reduced by inclusion of those data.

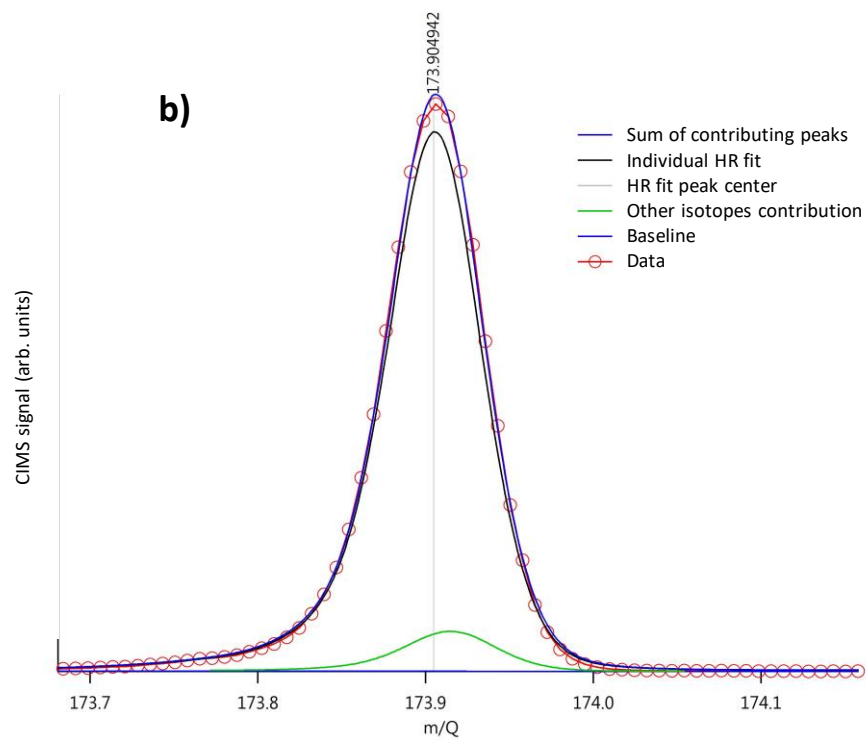

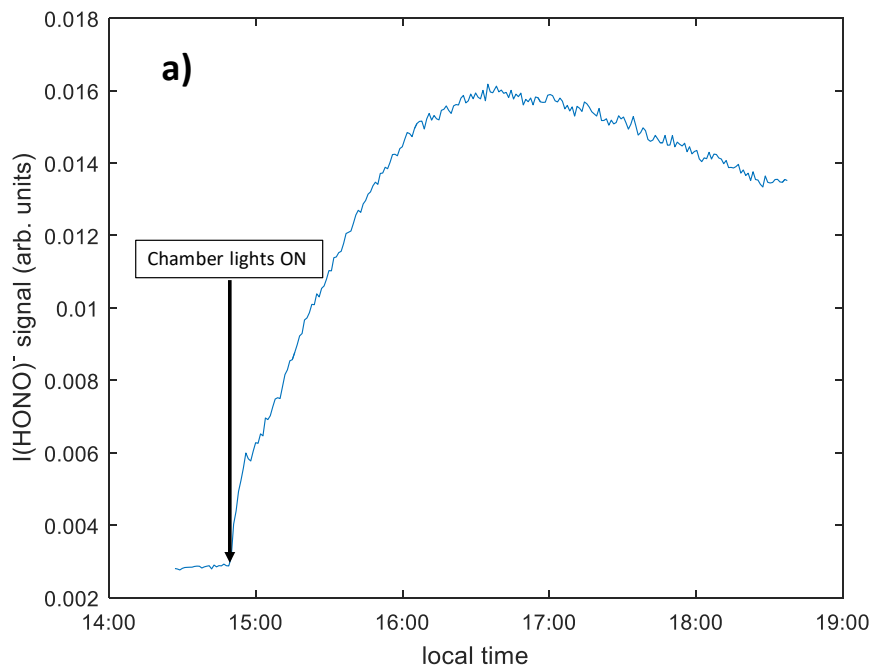

**Figure S1.** Simplified schematic of atmospheric simulation chamber and experiment setup.

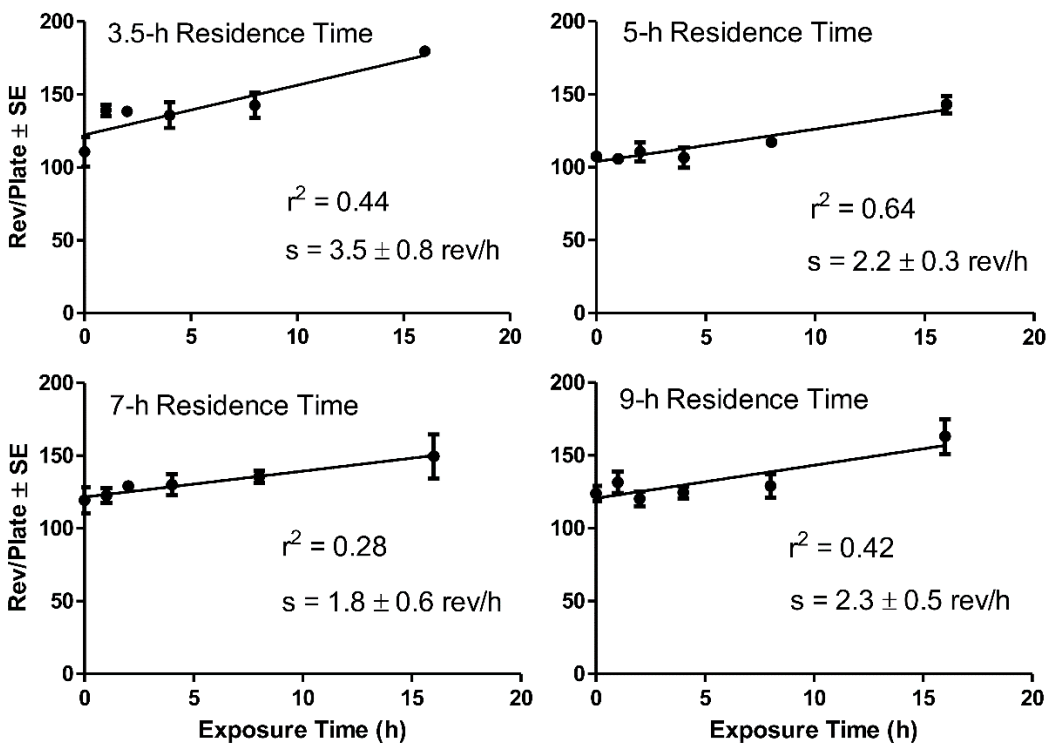

**Figure S2.** Plots of revertants plate<sup>-1</sup> versus exposure time for the dark-exposure experiments.

**Figure S3.** (a) Representative CIMS  $I(\text{HONO})^-$  time series during the transition from chamber lights off to lights on. (b) The associated high-resolution (HR) mass spectra peak fit and center for the  $I(\text{HONO})^-$  peak assignment.

**Figure S4.** Chemical structures for the potential organic compounds provided in Table 2 of the main text.

**Figure S5.** Plots of revertants plate<sup>-1</sup> versus exposure time for the ethylbenzene variable residence time experiments.

**Figure S6.** Relationship between residence time and mutagenic potency for the ethylbenzene variable residence time experiments; “s” is the slope.

**Figure S7.** Significant difference ( $P < 0.05$ ) in mutagenic potencies for initial ethylbenzene mixing ratios of 6.48 ppmC with 266 ppbv NO (4.5-h residence time) and 3.63 ppmC with 200 ppbv NO (5-h residence time).
