

Glypican-1 is enriched in circulating-exosomes in pancreatic cancer and correlates with tumor burden

SUPPLEMENTARY MATERIALS

Circulating exosomes (crExos)

Supplementary Figure 1: Post-operative circulating exosomal Glypican-1 levels are not associated with resection margin status. There was no difference in post-operative crExos Glypican-1 levels when comparing R0 ($n = 7$) vs. R1 ($n = 4$) resections.

Supplementary Figure 2: Exo-Check antibody array showing expression of exosomal markers in plasma crExos from patients. The arrays confirmed expression of exosomal markers in our patient plasma crExos samples, including CD63 and/or CD81. Three representative blots are shown.
