**Supplementary Figure 1: Quantile-quantile (QQ) plots from the discovery stage.**

The QQ plot for associations between all analyzed single nucleotide polymorphisms (SNPs) and myopic maculopathy in the discovery stage. Each blue dot represents an observed statistic (defined as  $-\log_{10} P$ ) versus the corresponding expected statistic before genomic control, while each red dot represents the observed statistic versus the corresponding expected statistic after genomic control. The black line corresponds to the null distribution.
