Methods

The *Clostridium difficile* cell lysis assay was performed as described previously (Ericsson et al., 1960). A single colony UK6 was inoculated into BHIS and cultured at 37°C for 24 h; afterwards, 200 µL of UK6 were mixed with 20 mL of BHIS to make UK6-seeded plates. After solidification, 1.0 µL aliquots of vancomycin or M864 extracts WG1-60-60 and WG1-60-61 with different concentrations, 1 or 2 mg/mL, respectively, were dropped onto the plate. Plates were kept at 37°C in an anaerobic chamber for 24-48 h until the inhibition zone is clearly seen. Methanol is included as a negative control.

Results

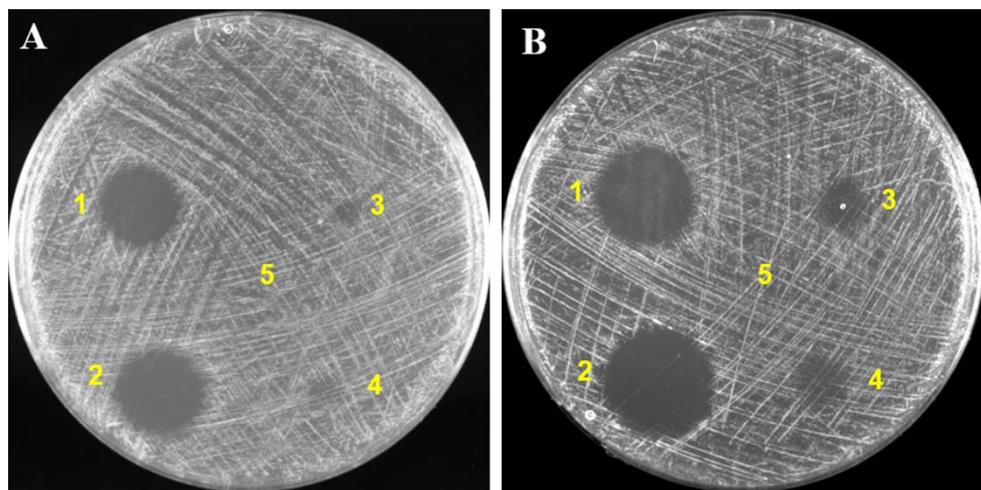

Figure S1. Antibacterial activity of the compound **1** using cell lysis assay. Moderate inhibition of *C. difficile* growth was observed. An aliquot of 2 μ L sample solution at either 3.2 mg/mL (**A**) or 6.4 mg/mL (**B**) was dropped onto the UK6-seeded plate. 1, 2: vancomycin; 3, 4: compound **1**; 5: methanol. No inhibition of other bacterial pathogens, *S. aureus*, MRSA and *P. aeruginosa*, are observed.

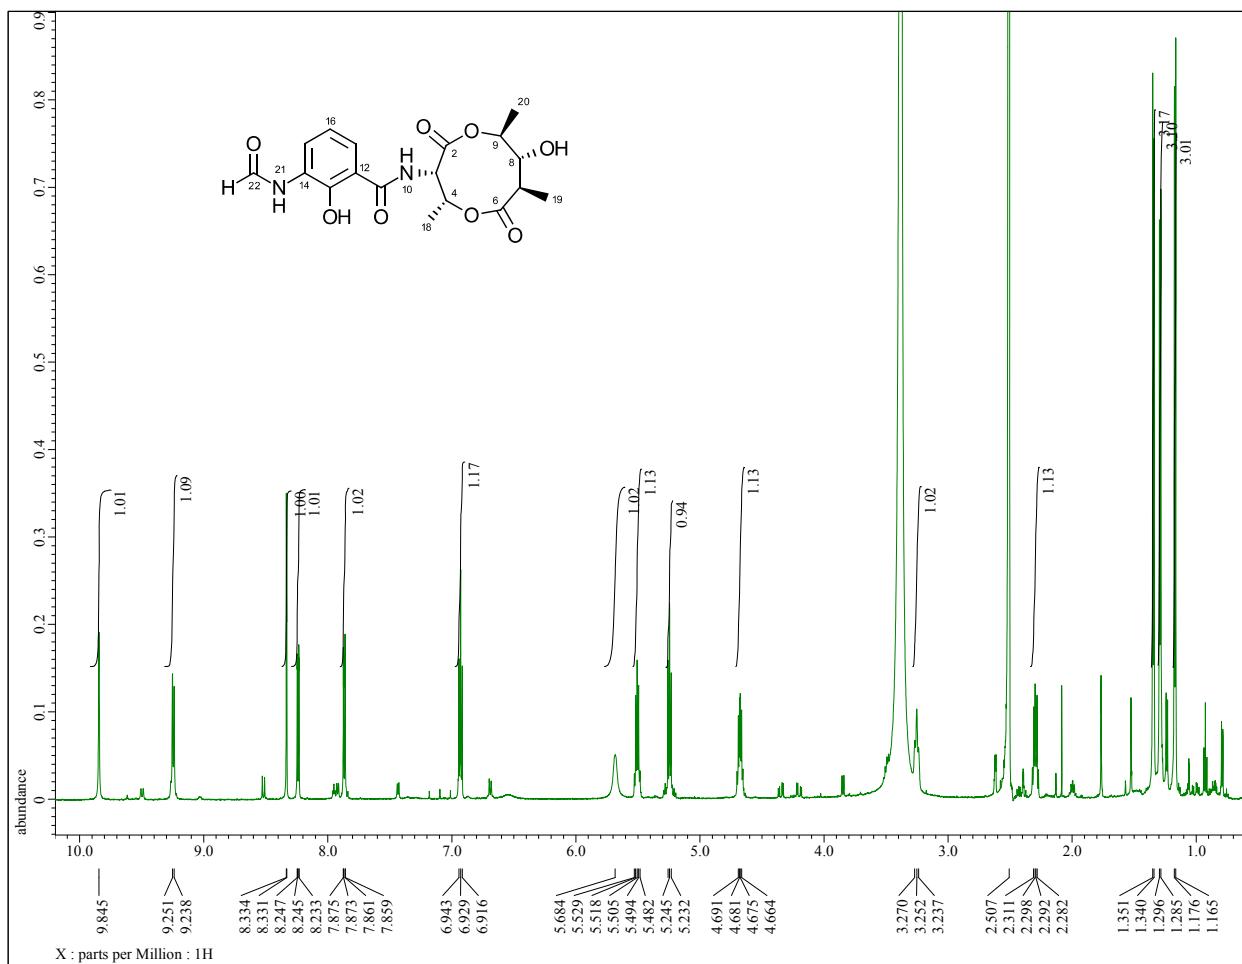

Figure S2. ^1H NMR spectrum of compound 1 in $\text{DMSO}-d_6$.

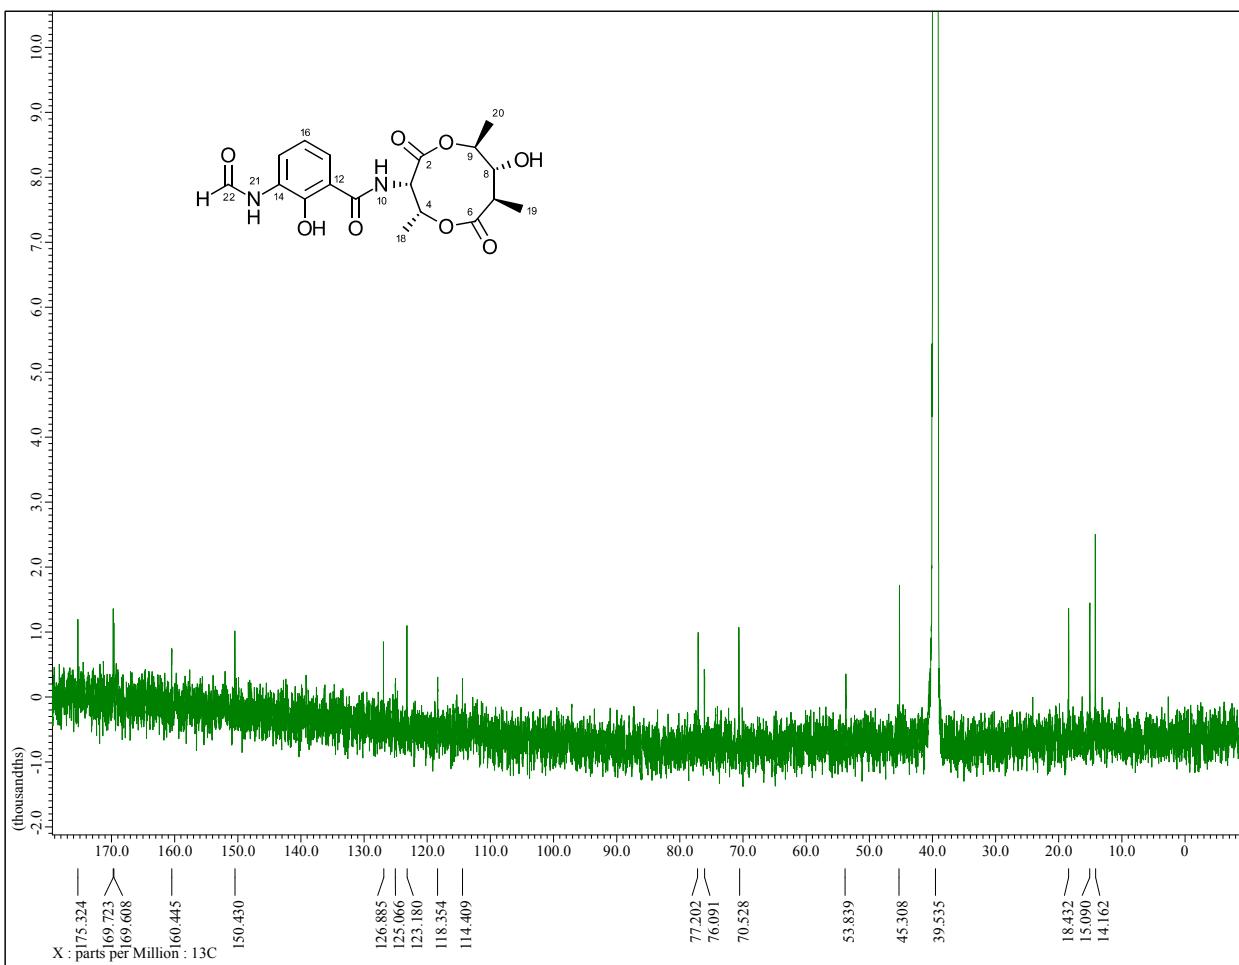

Figure S3. ^{13}C NMR spectrum of compound **1** in $\text{DMSO}-d_6$.
