

S3 Fig. **Higher MOI does not substantially increase virus production.** Virus yield (pfu per mL) plotted as a function of time post-infection from cells infected at different MOIs (10, 25, 50 and 100). The initial differences in virus yield at early times is a direct reflection on the input MOI. At 6 and 8 h post-infection no substantial differences in yield of virus are observed. Data are represented as means \pm SEM. n= 3.
