

# Genome-wide multi-omics profiling of the 8p11-p12 amplicon in breast carcinoma

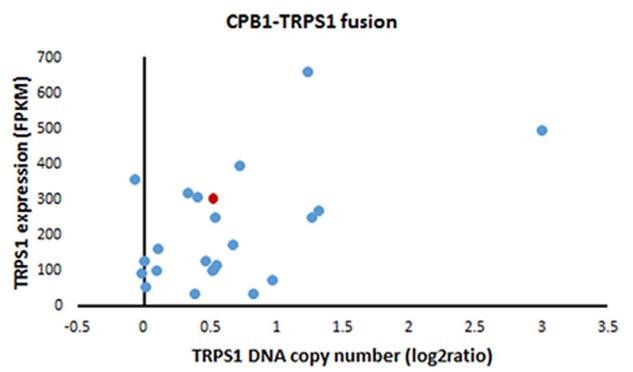

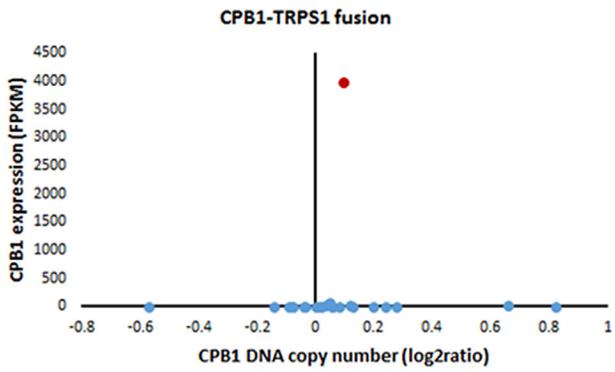

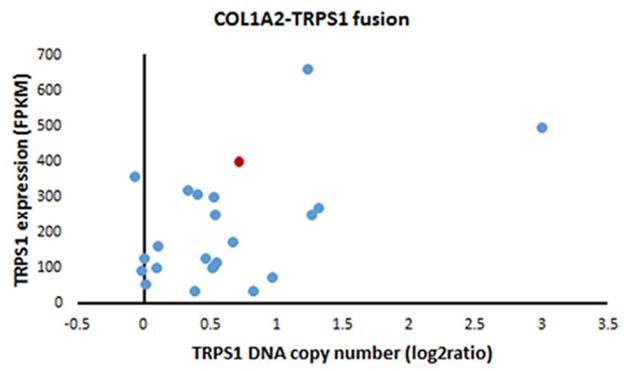

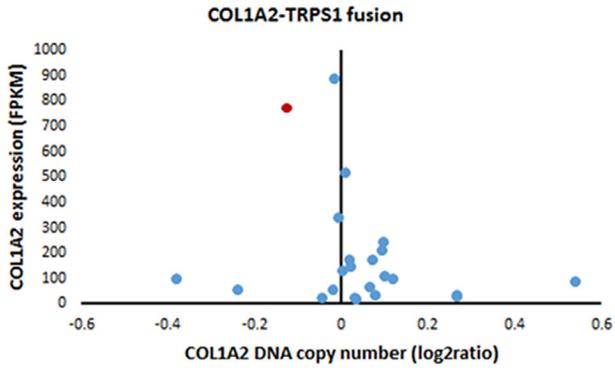

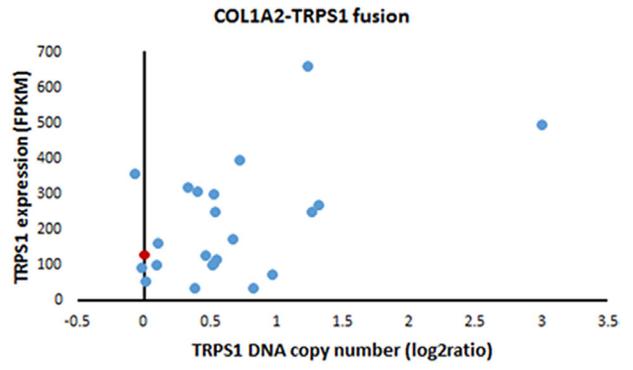

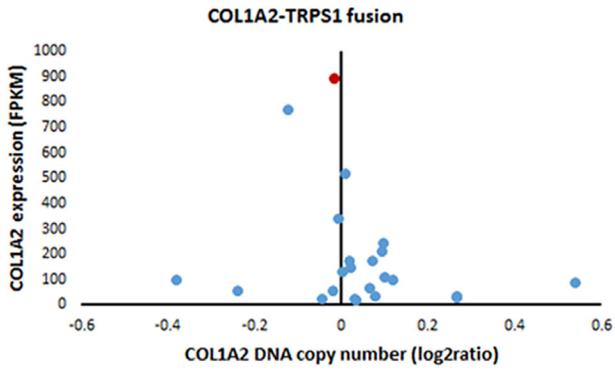

## SUPPLEMENTARY MATERIALS

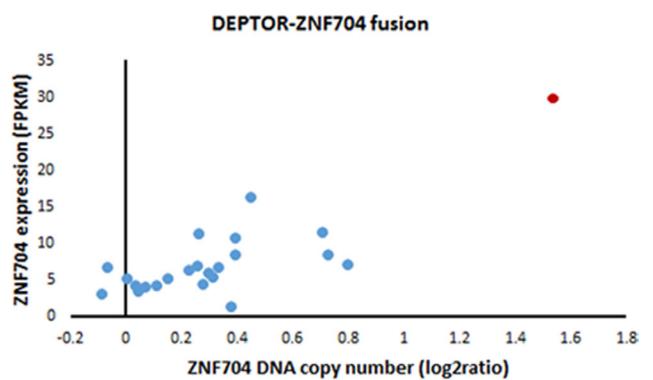

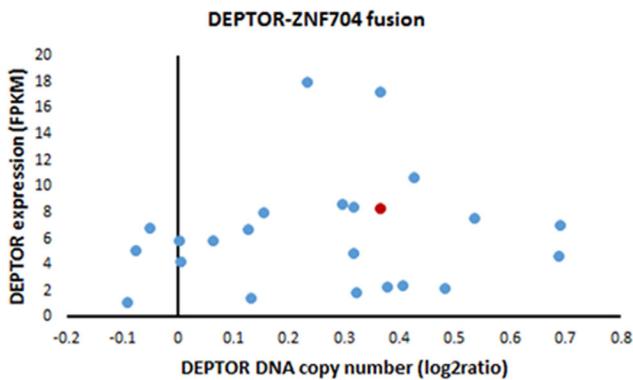

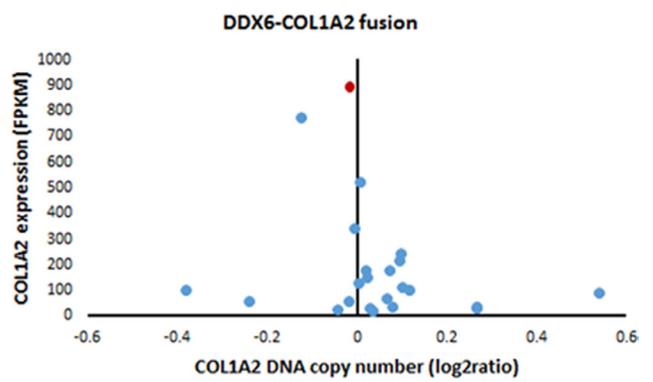

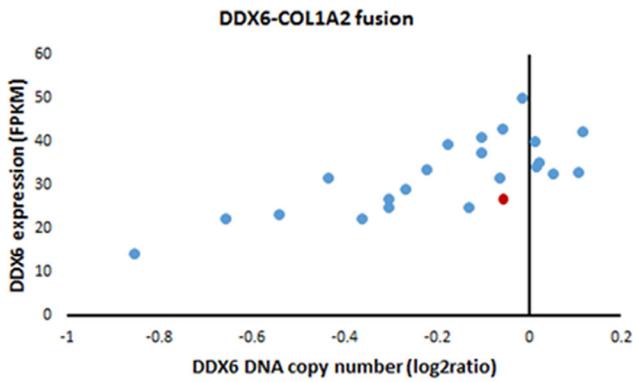

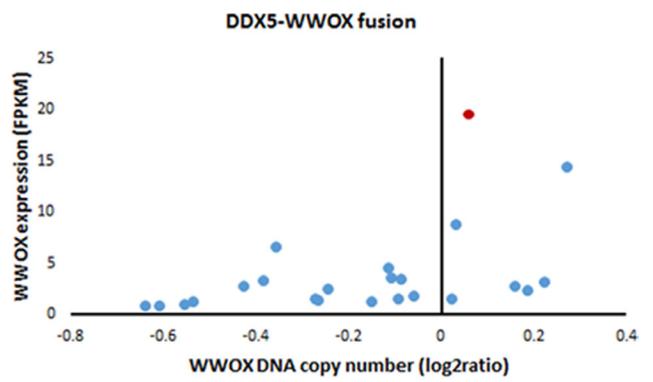

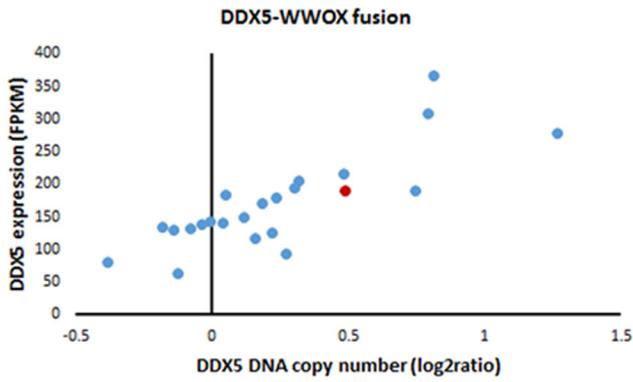

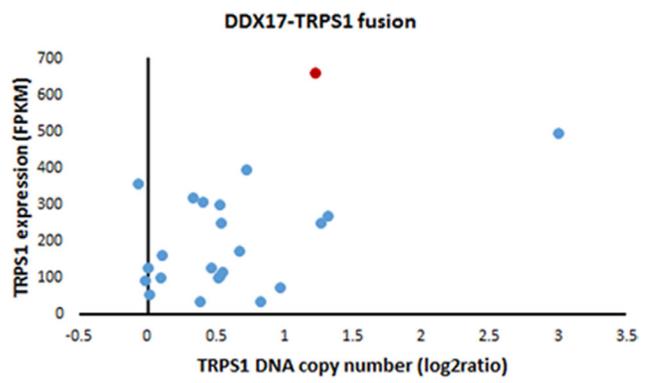

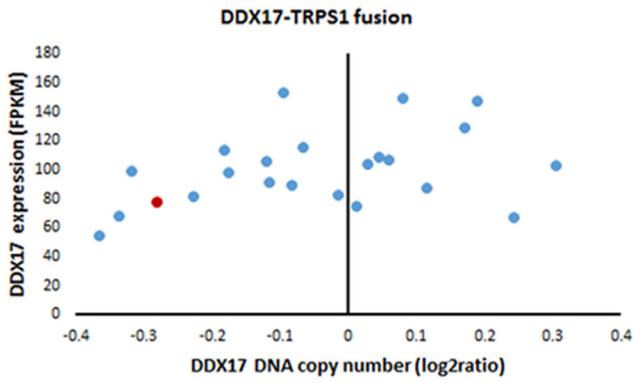

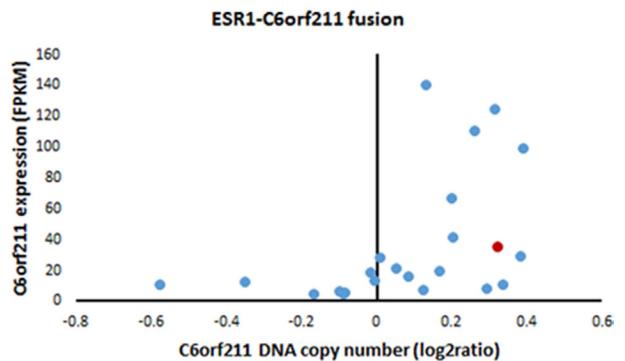

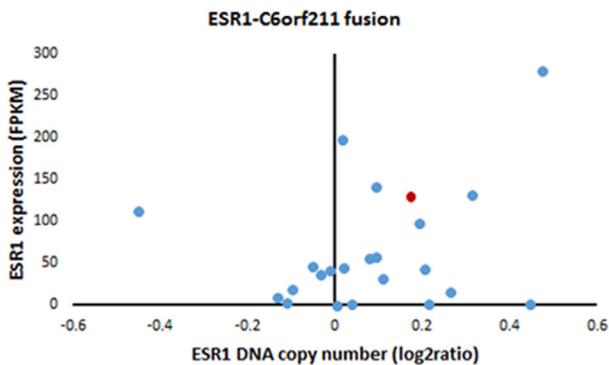

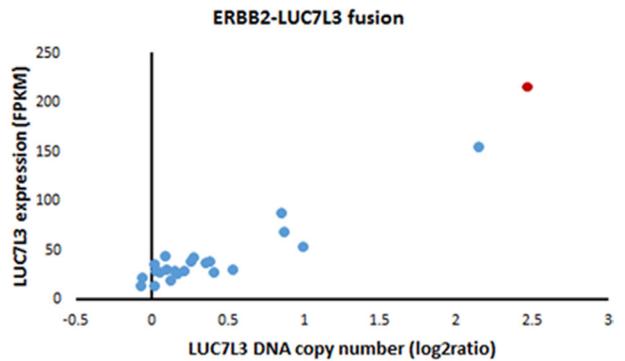

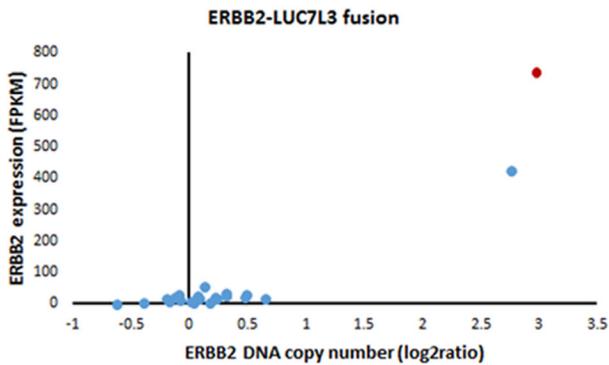

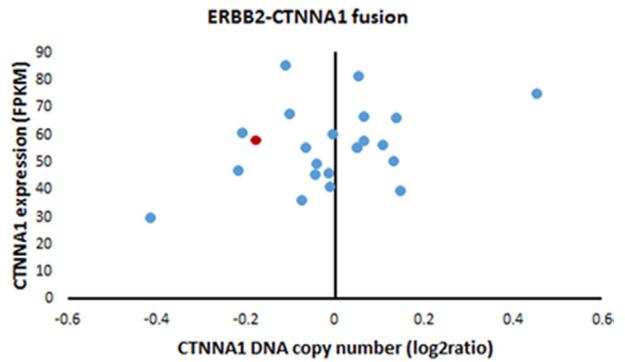

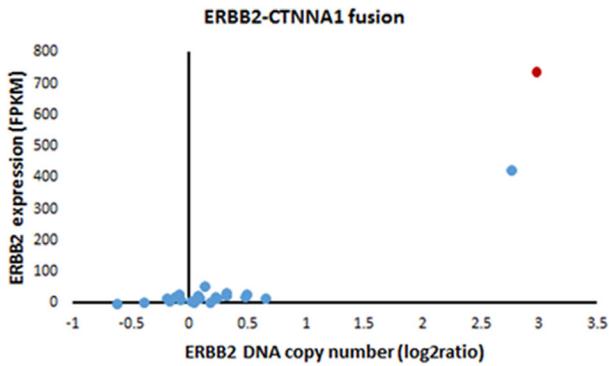

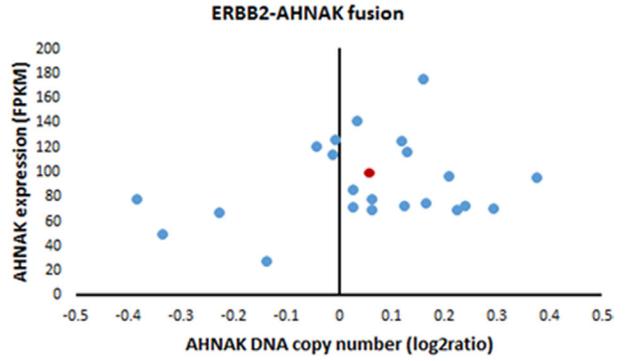

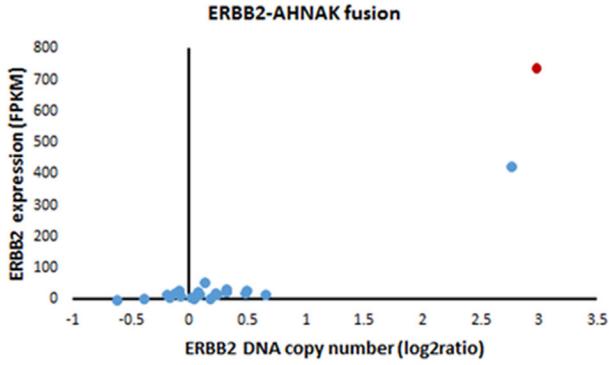

**Supplementary Figure 1: The *MALAT1* ncRNA is a promiscuous gene fusion partner in 8p11-p12 amplified breast carcinomas.** Bar plots depicting (A) recurrent fusion transcripts found in at least five samples, (B) the distribution of the predicted effect of the 3,052 identified fusion transcripts, (C) intrachromosomal fusions, and (D) the number of unique gene fusion partners in the top 20 chromosome (chr) pairs.

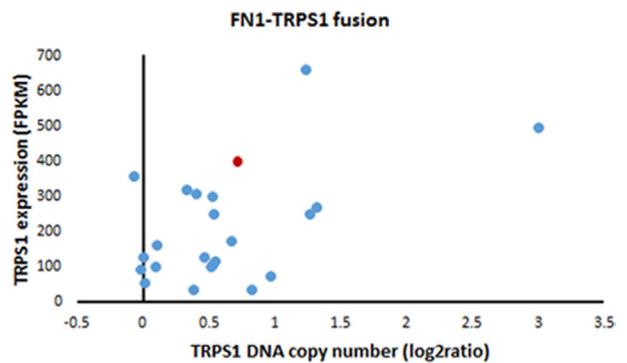

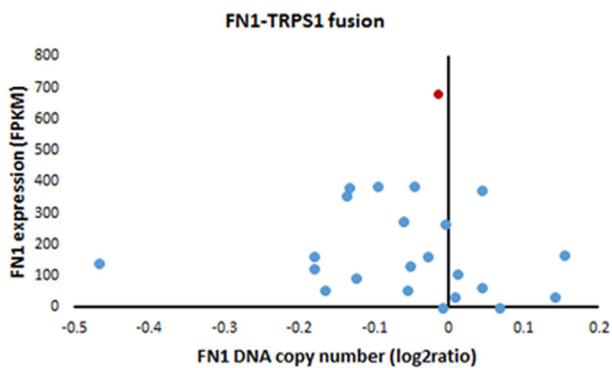

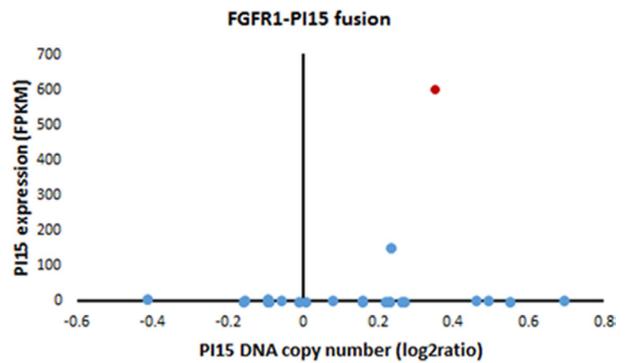

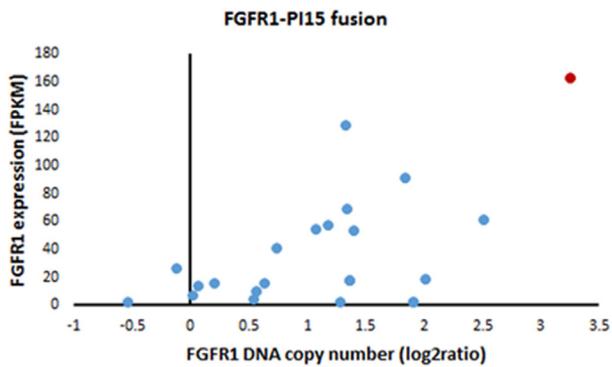

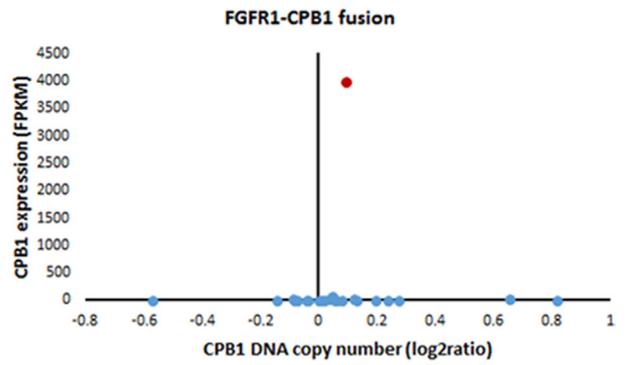

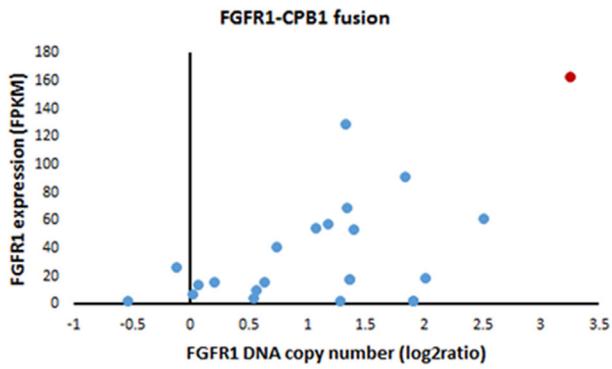

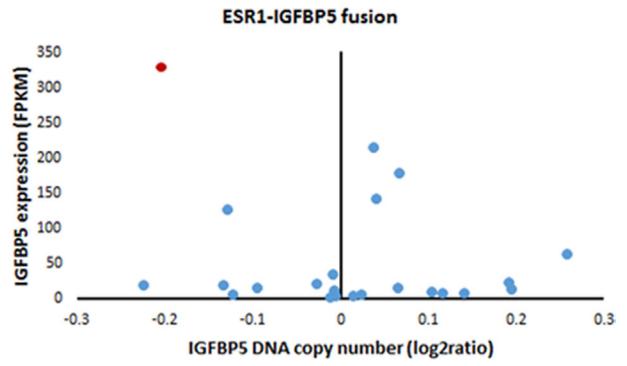

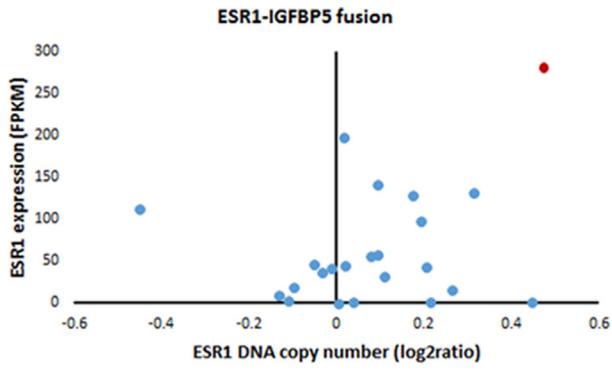

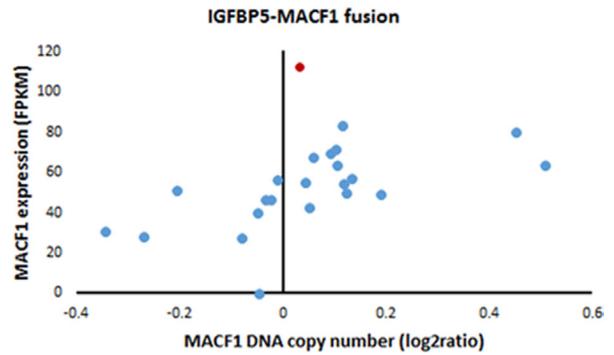

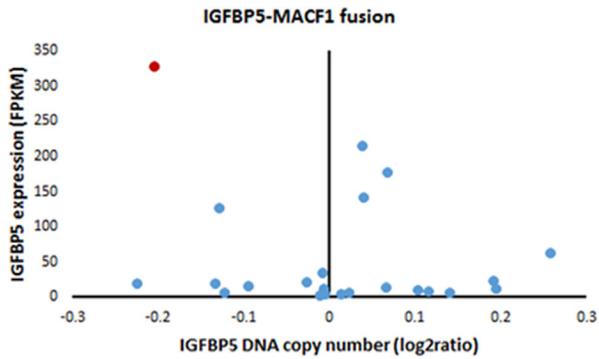

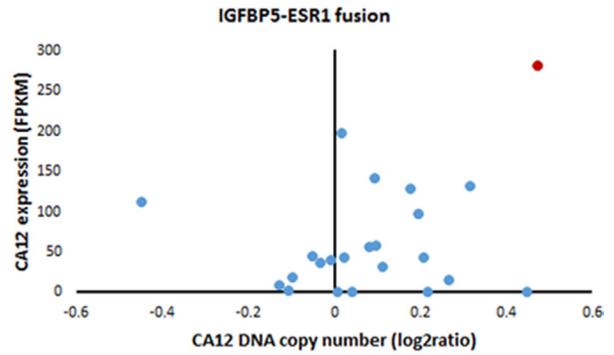

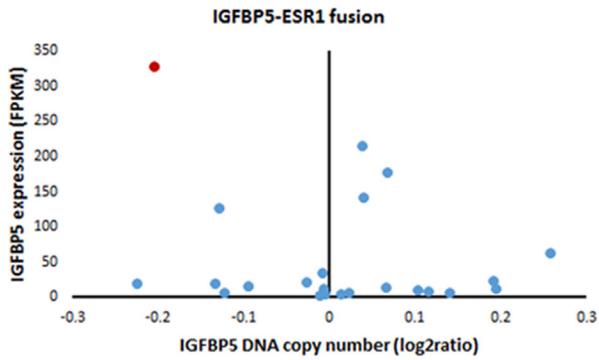

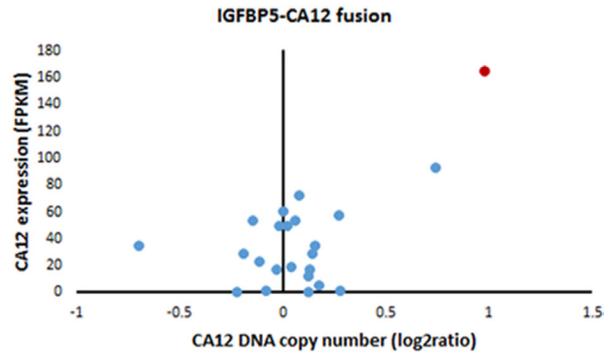

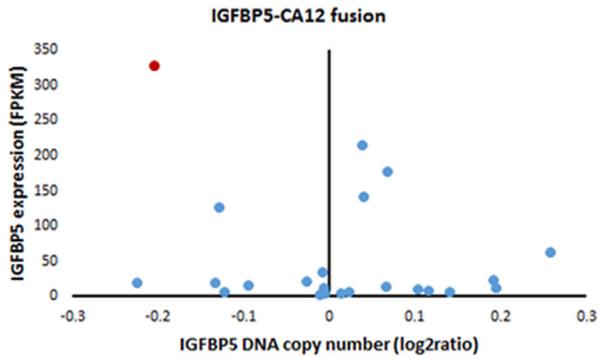

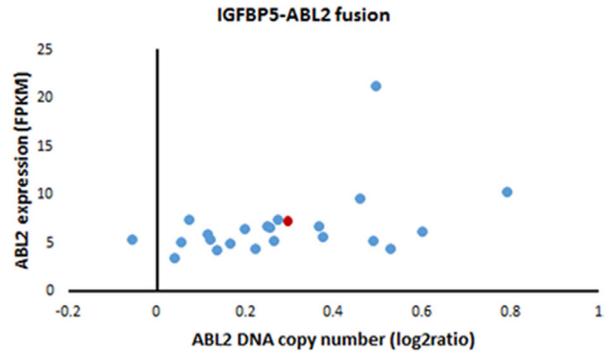

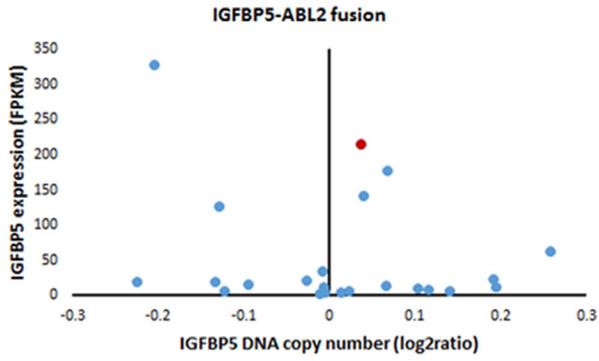

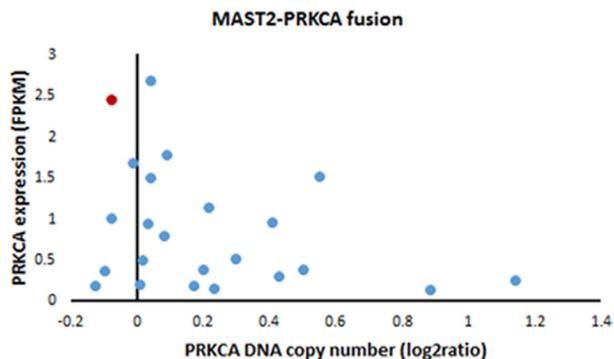

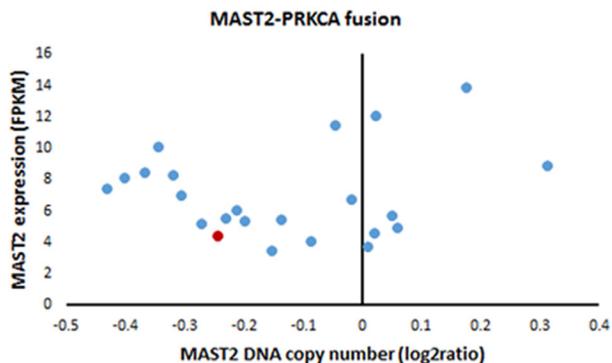

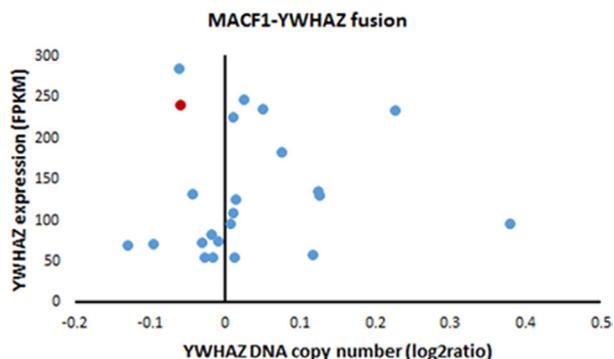

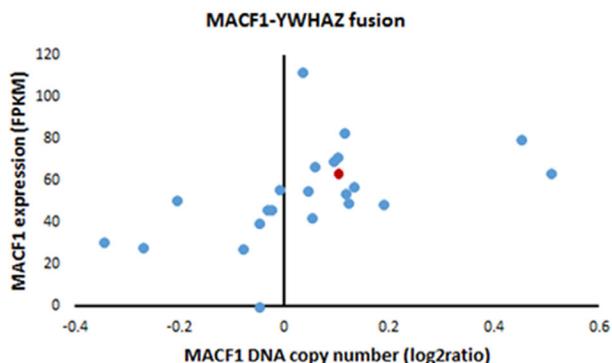

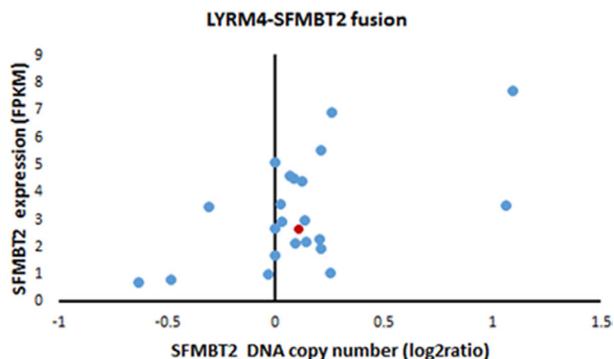

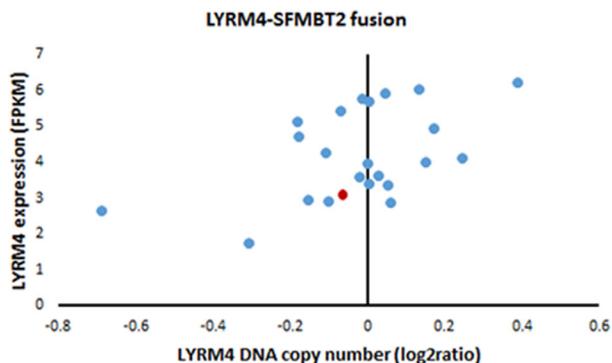

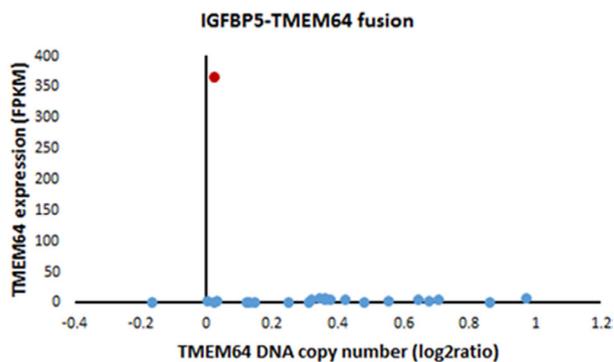

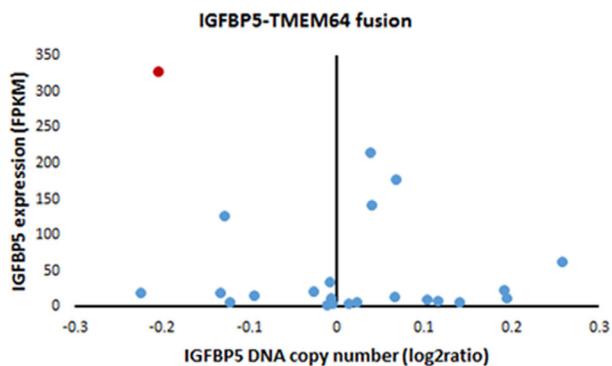

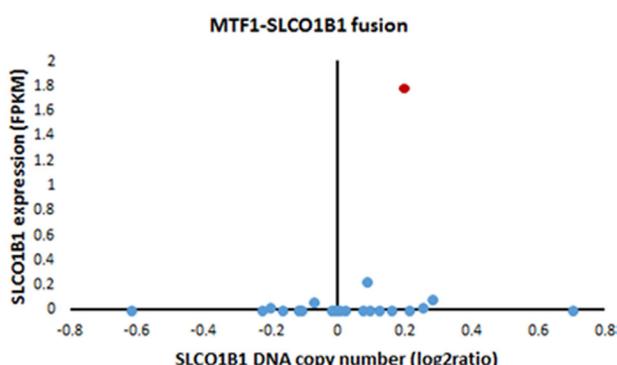

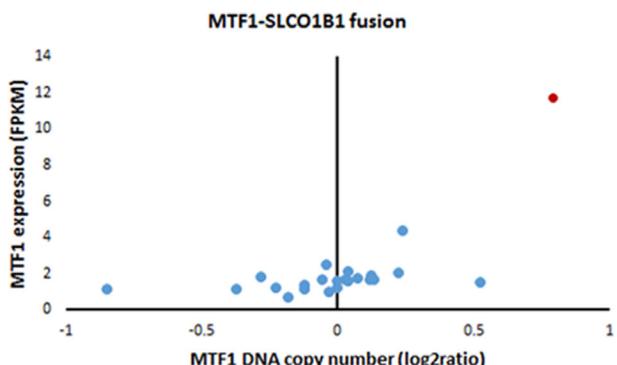

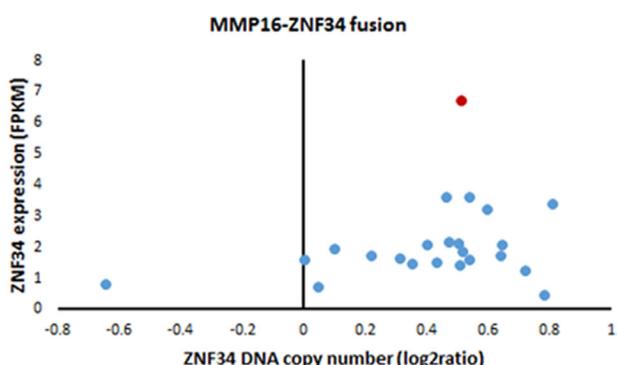

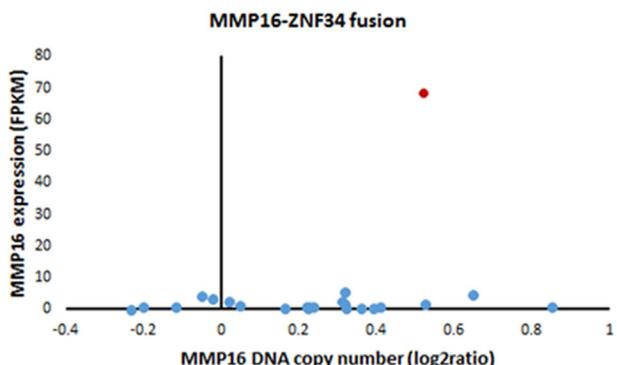

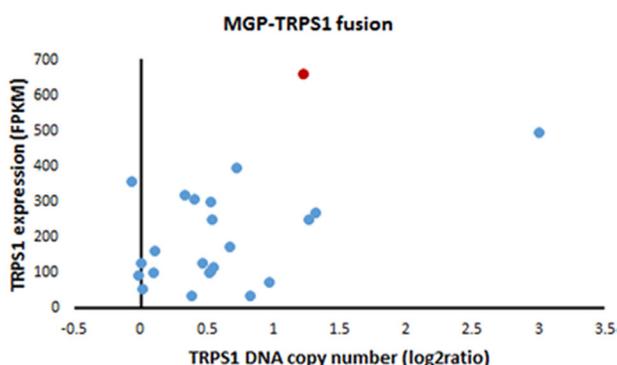

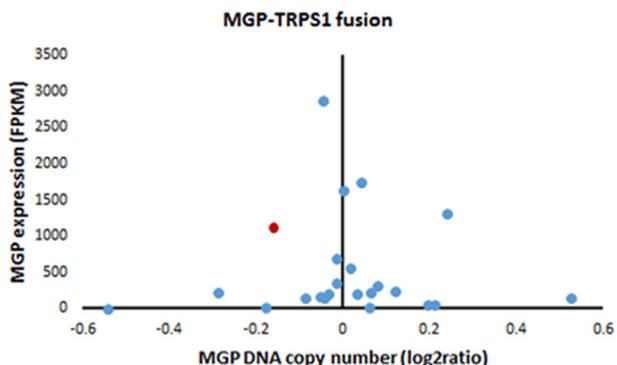

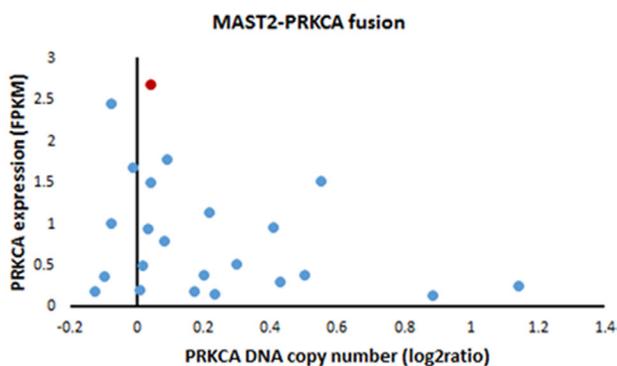

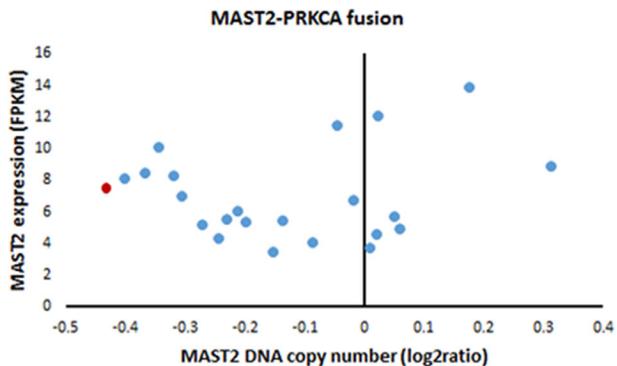

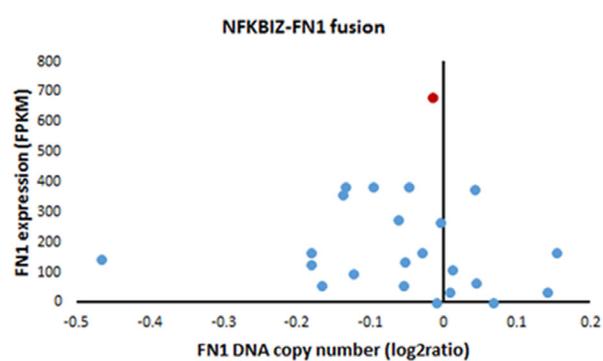

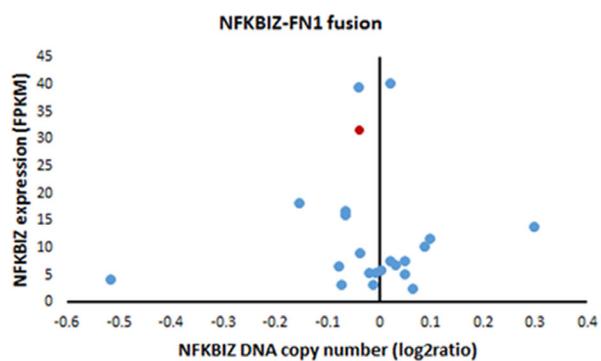

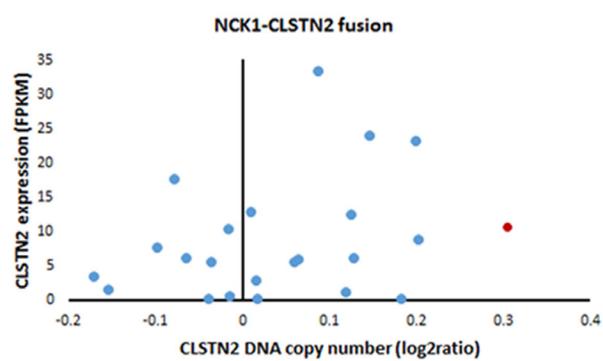

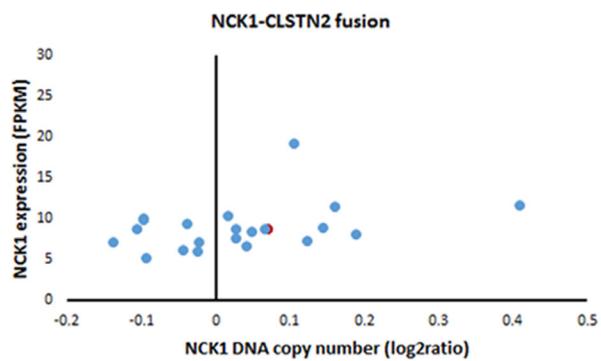

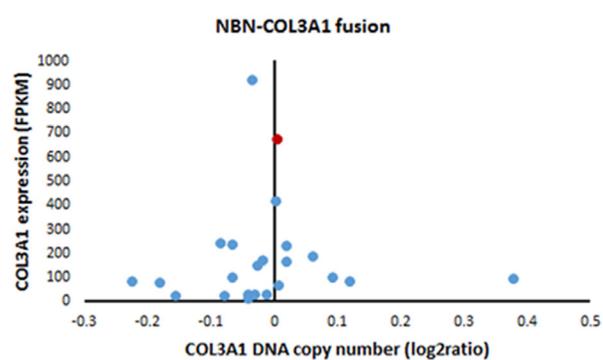

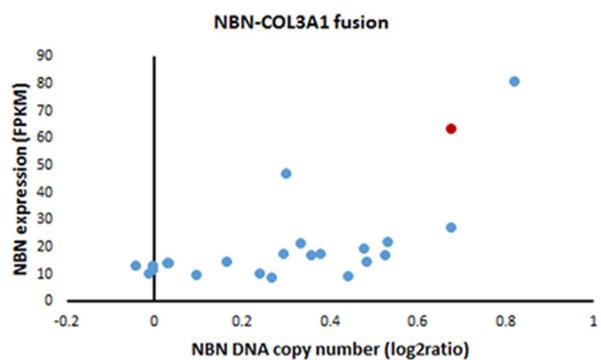

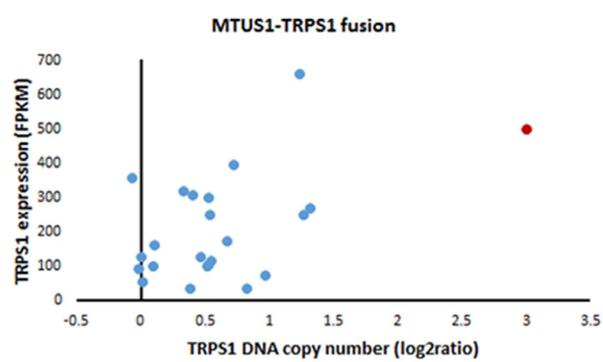

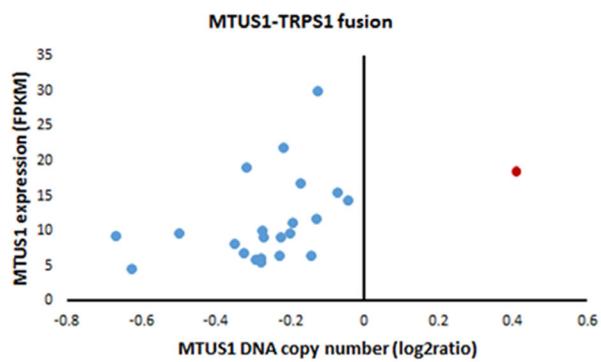

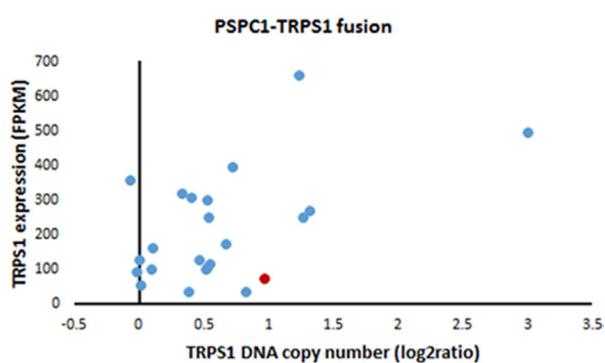

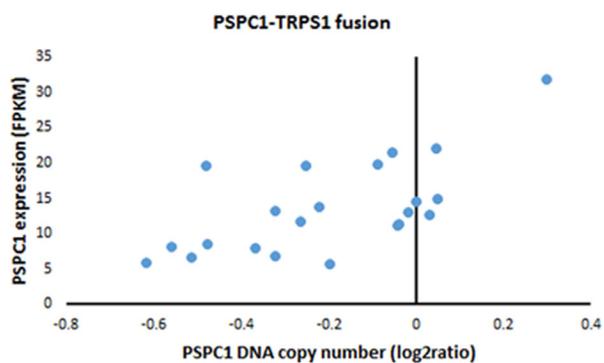

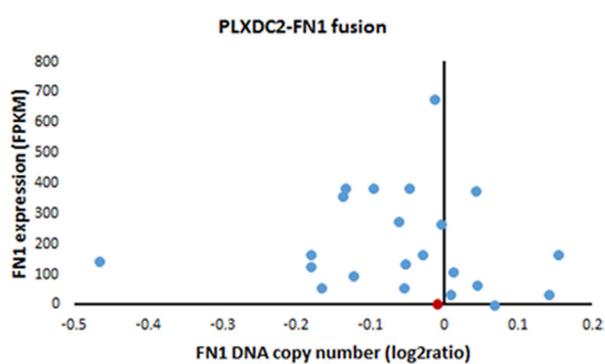

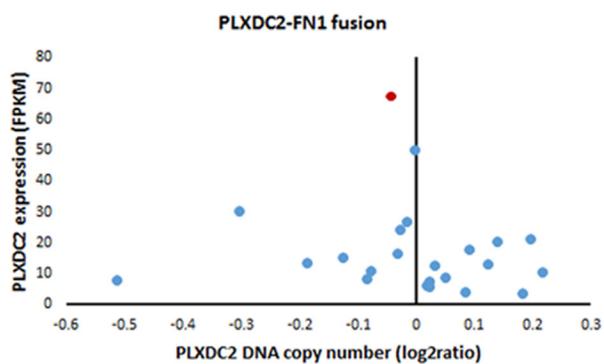

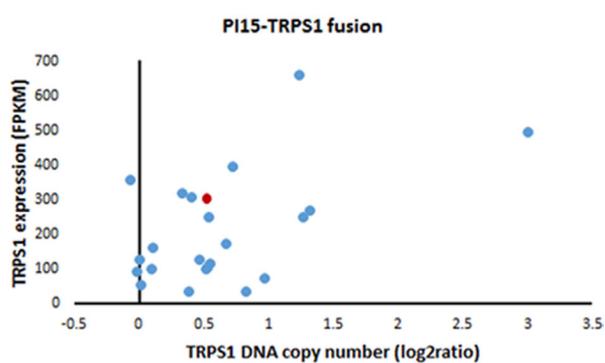

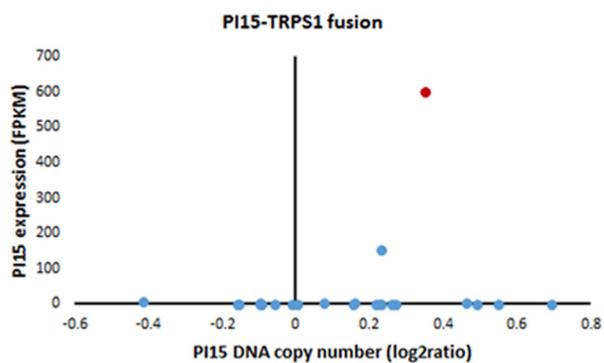

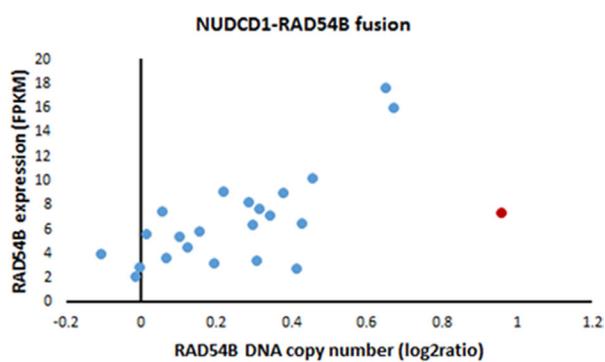

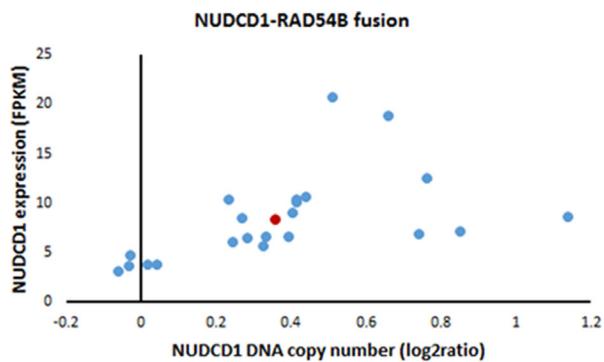

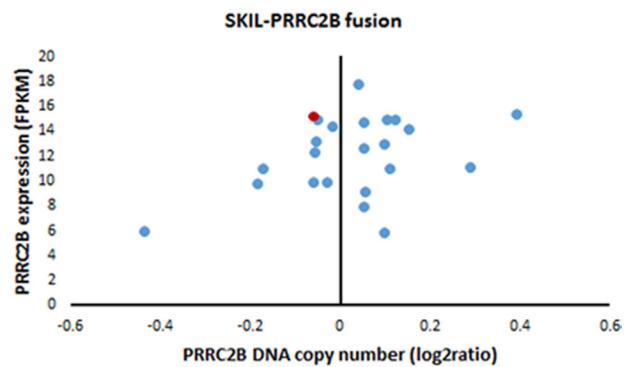

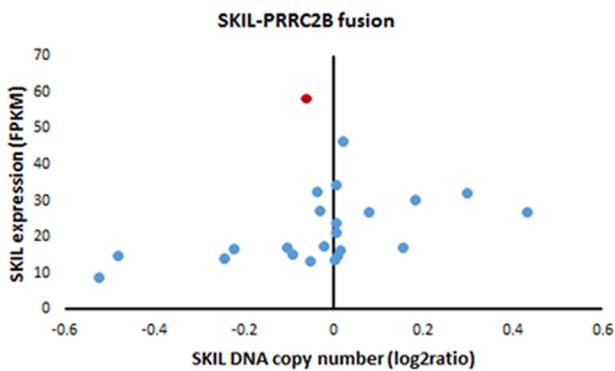

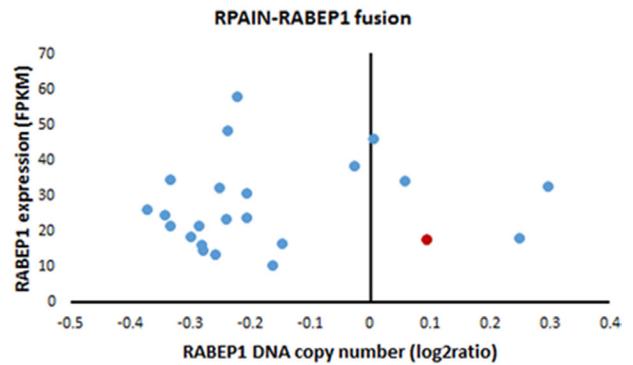

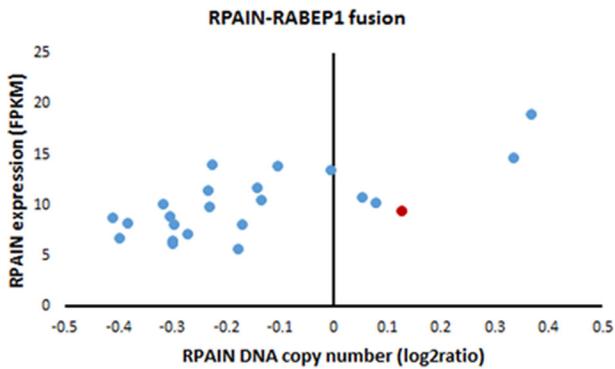

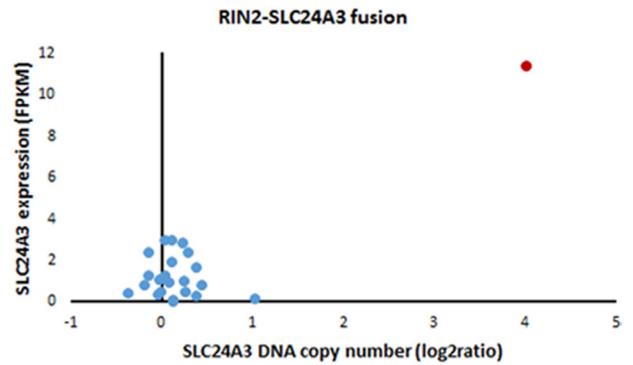

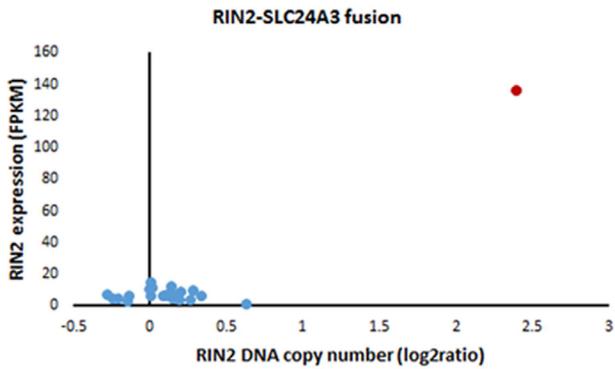

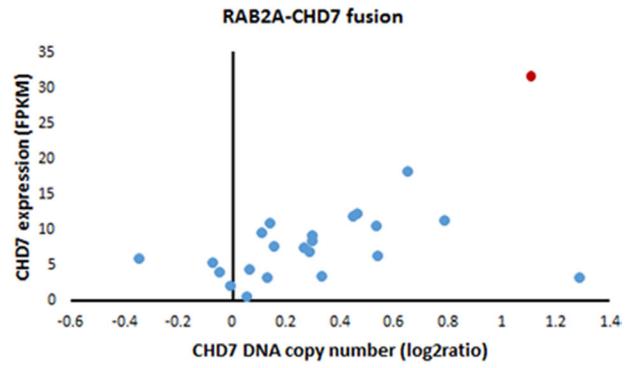

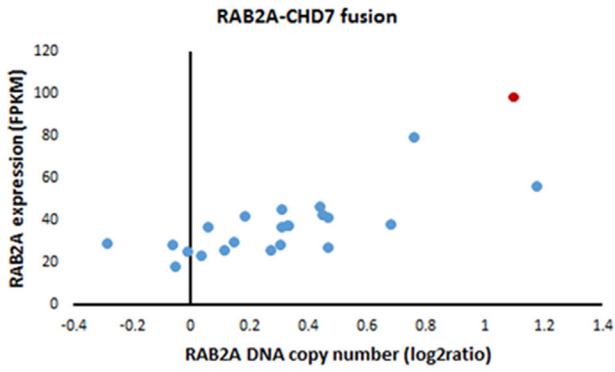

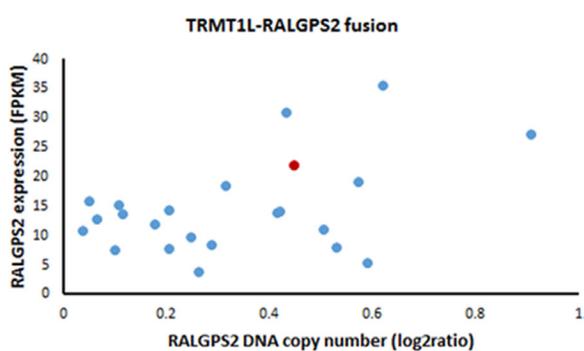

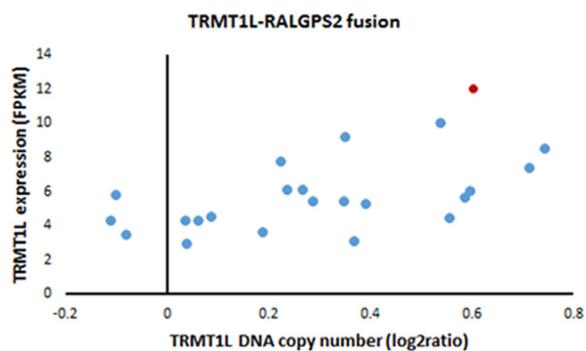

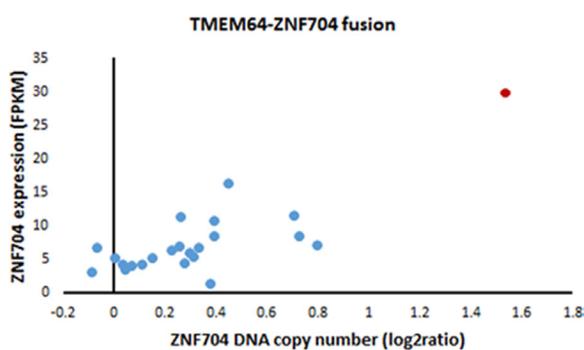

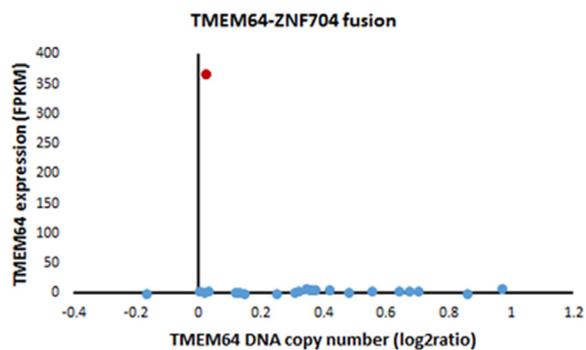

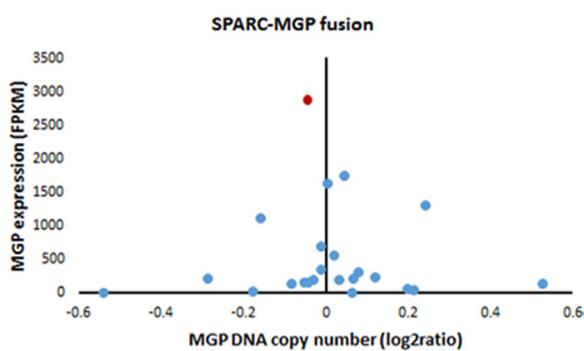

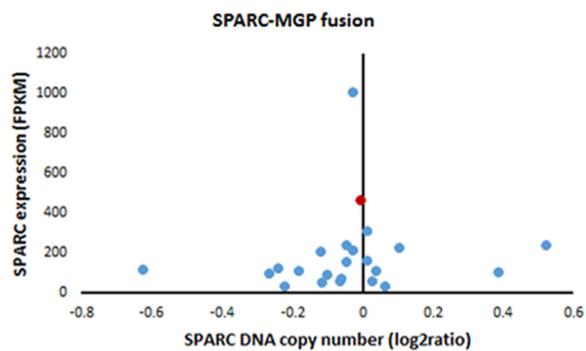

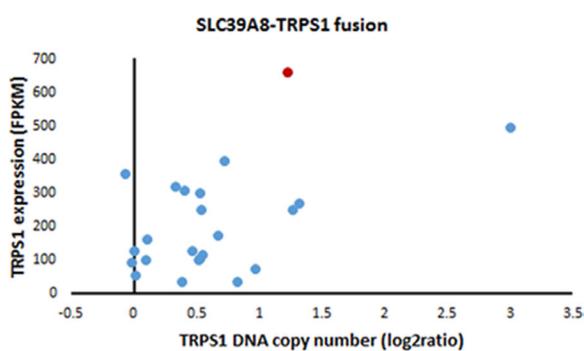

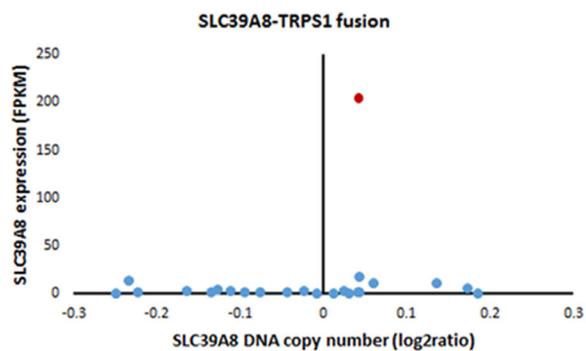

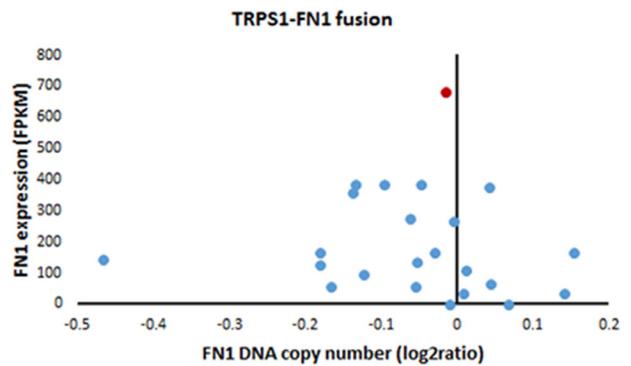

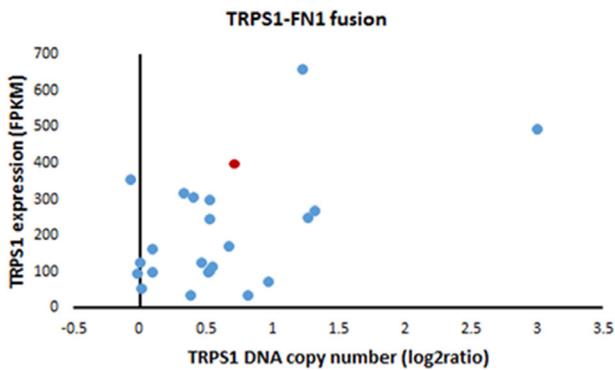

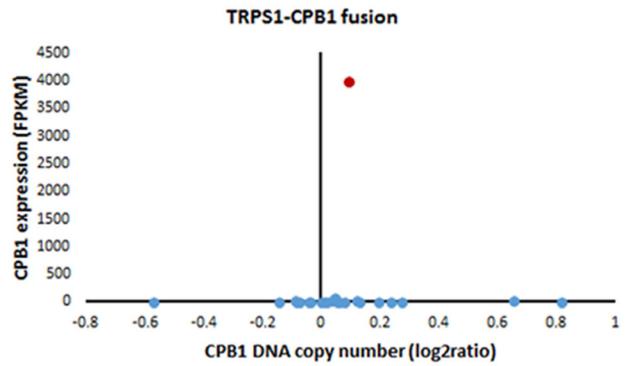

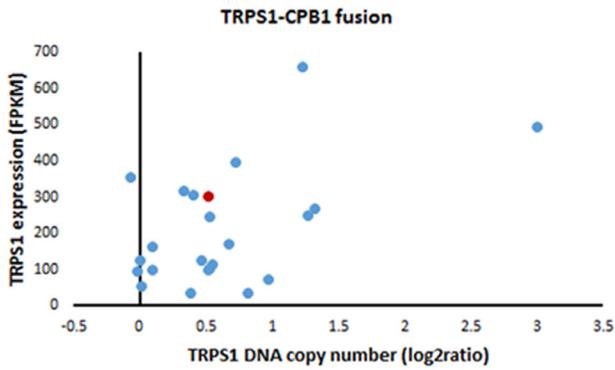

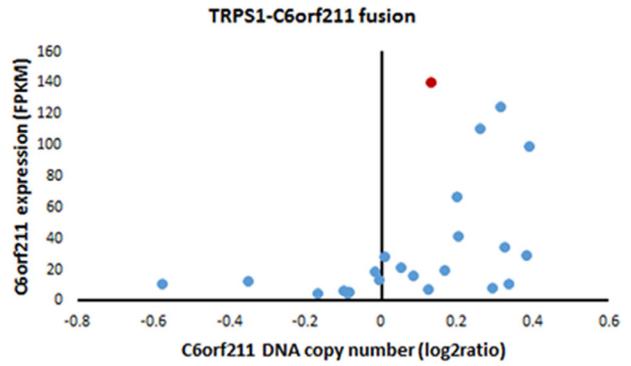

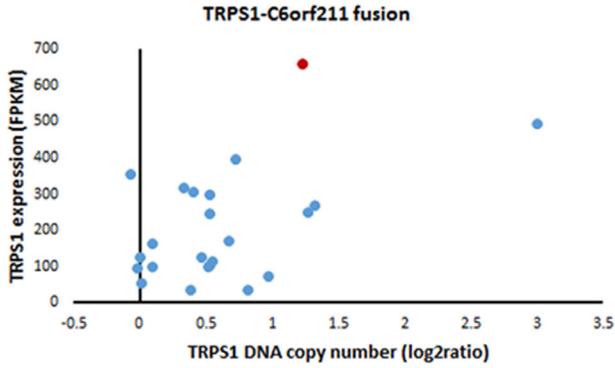

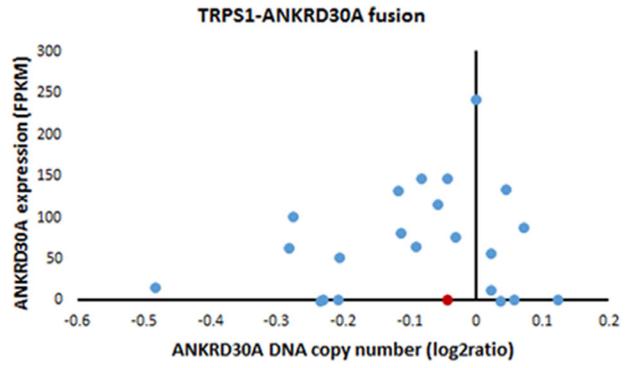

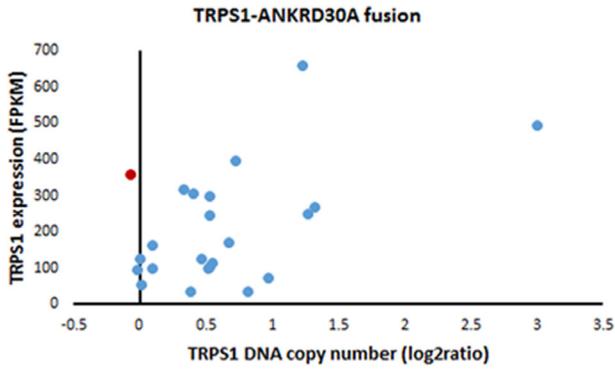

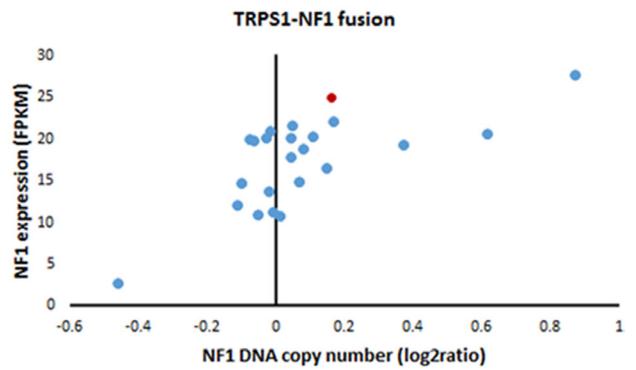

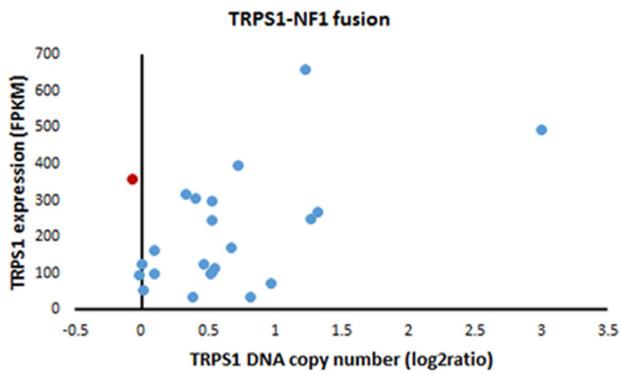

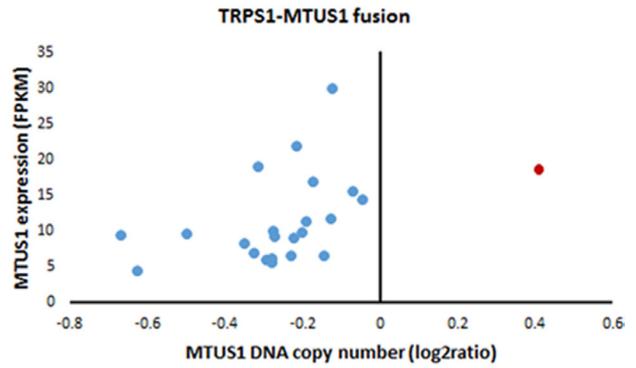

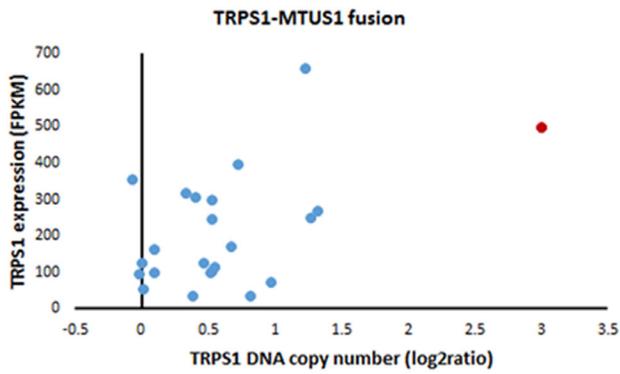

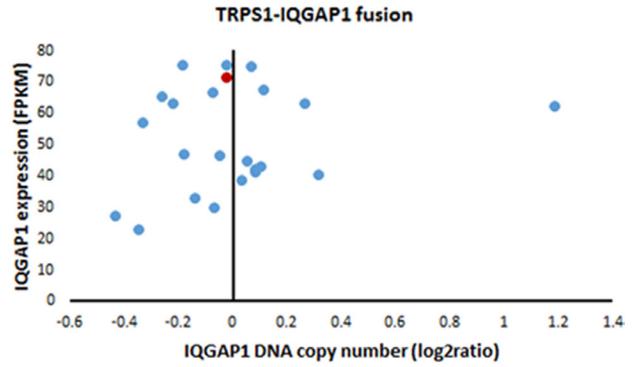

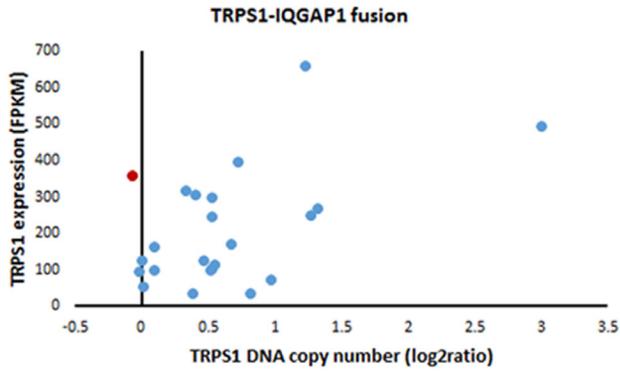

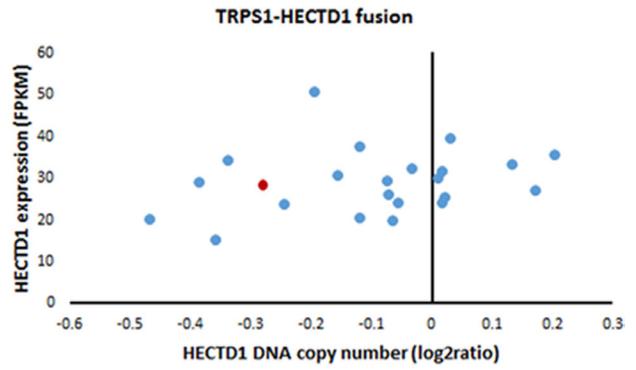

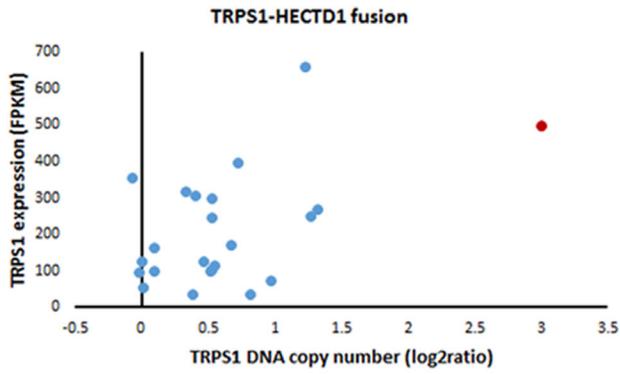

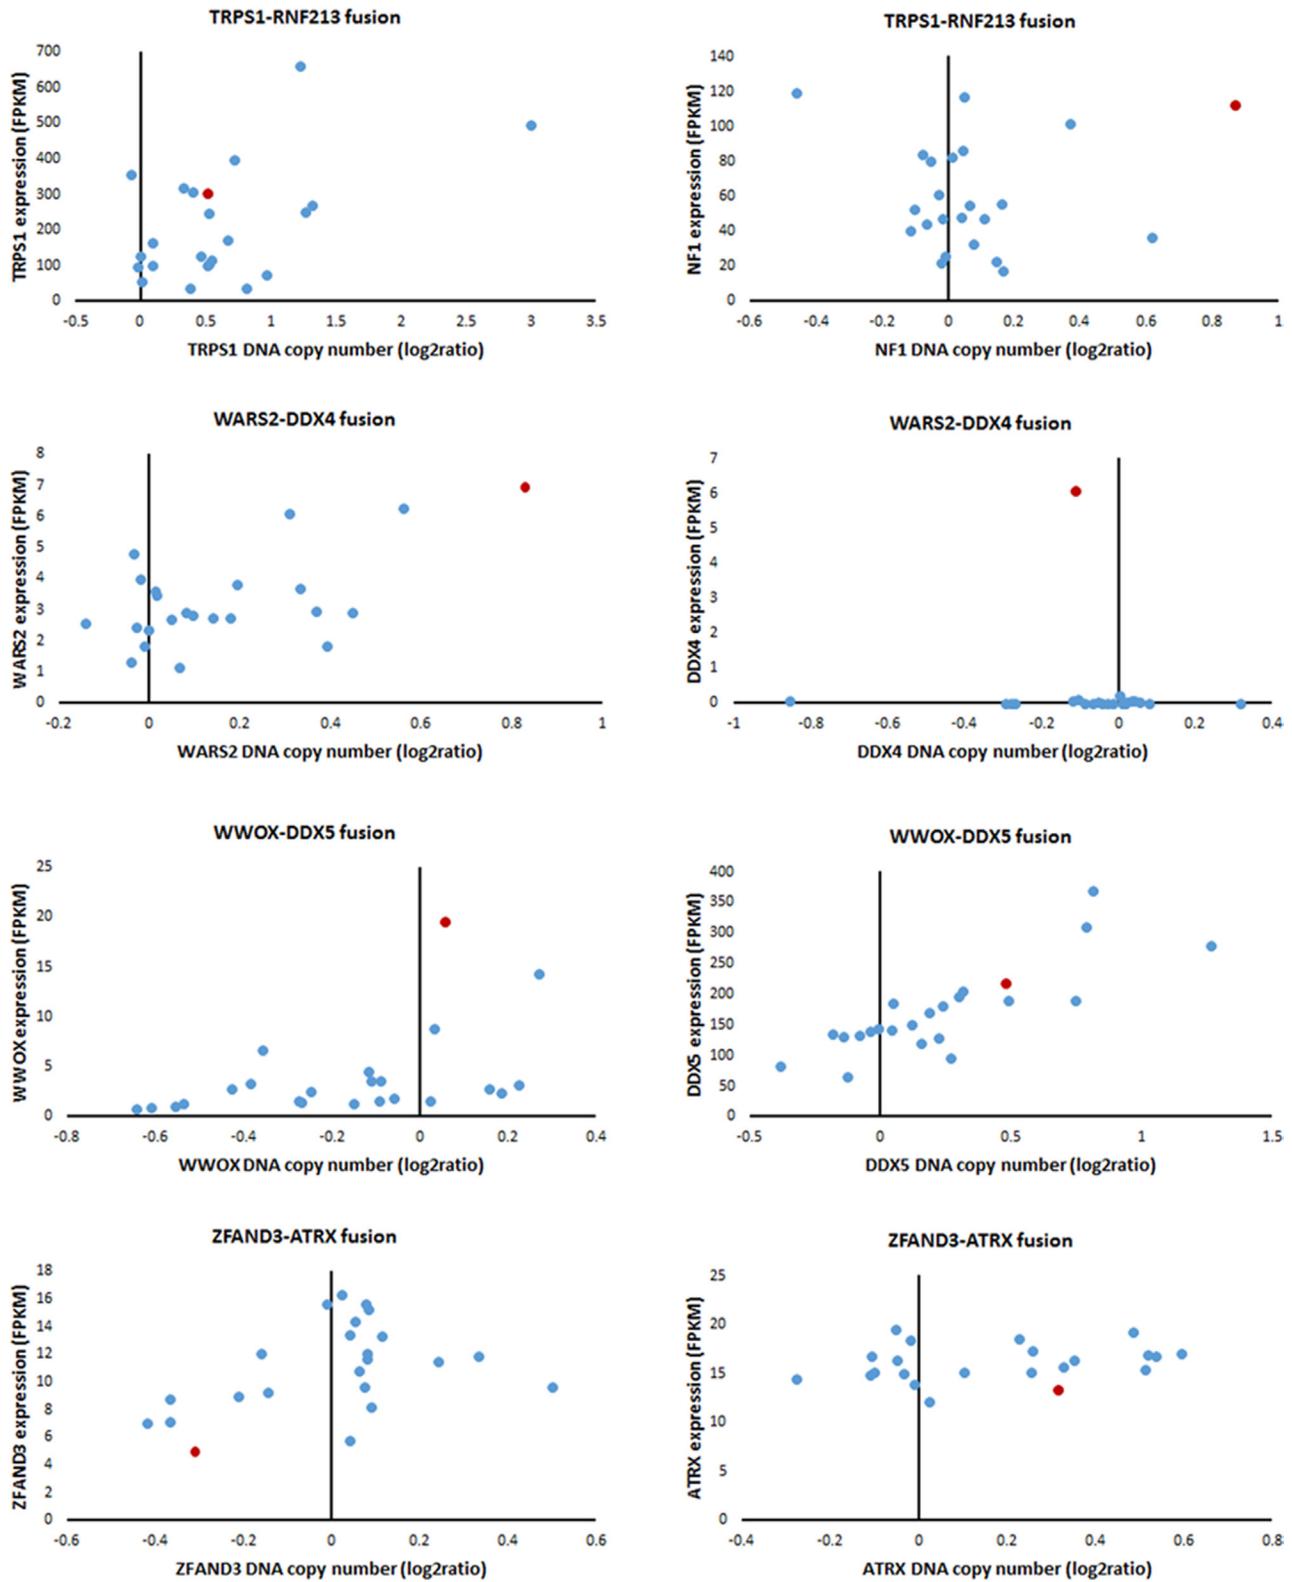

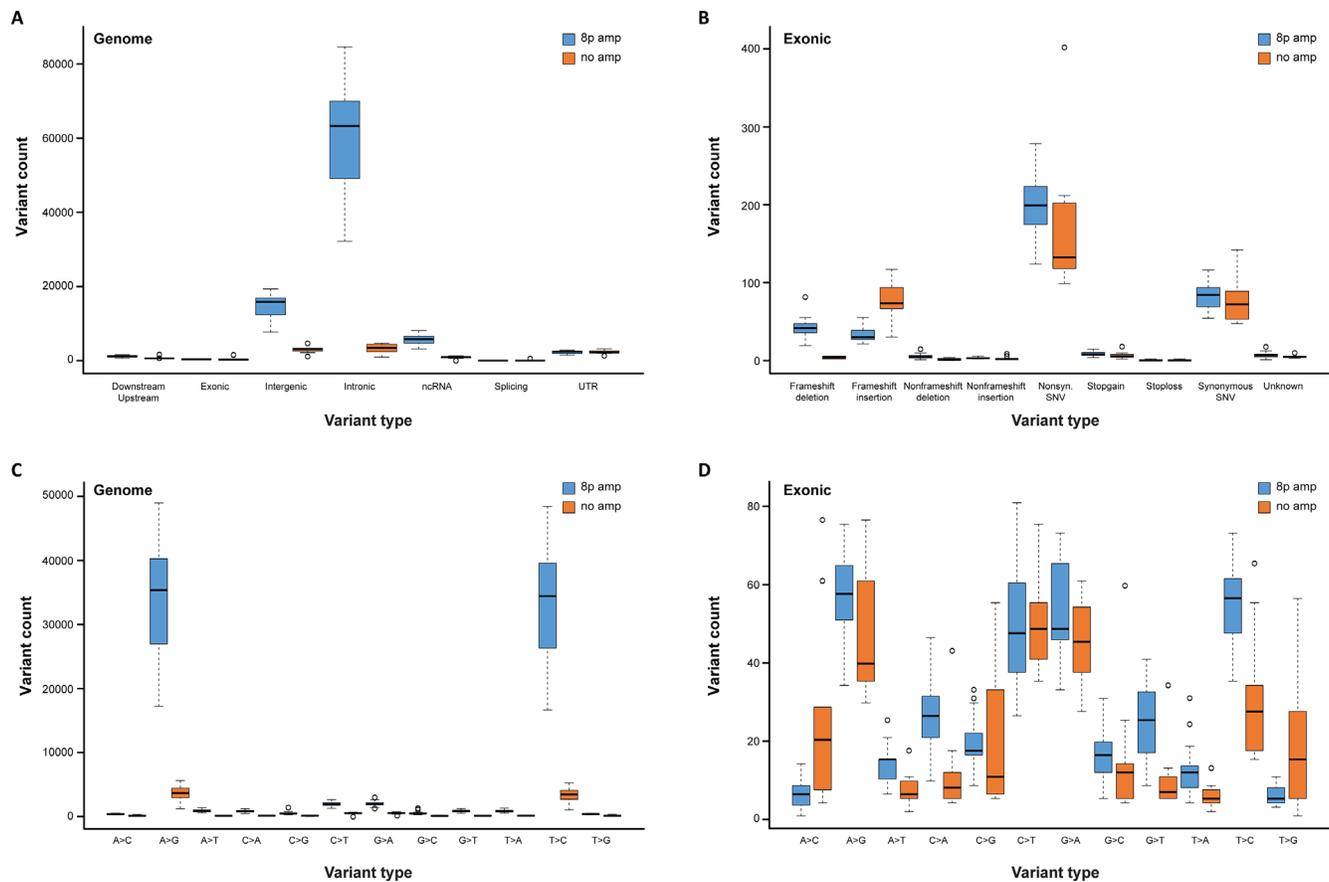

**Supplementary Figure 2: Gene expression patterns for gene fusion partners are frequently unrelated to DNA amplification.** Scatterplots illustrating gene expression levels (FPKM, y-axis) and DNA copy number (log<sub>2</sub>ratio, x-axis) for the 3'- and 5'-gene fusion partners. Red and blue dots depict samples with and without the gene fusion, respectively. DNA amplification is defined as log<sub>2</sub>ratio ≥ 0.5.

**Supplementary Figure 3: Mutational load is independent of 8p11-p12 amplification status in breast carcinomas.** Box plots illustrating (A–B) the number of genetic variants (y-axis) in genomic and exonic regions (x-axis) for 8p11-p12 amplification (denoted *8p amp*) and the TCGA breast carcinoma samples with neutral 8p11-p12 copy number (denoted *no amp*); and (C–D) the number of base-pair substitutions in genomic and exonic regions (y-axis) and the nucleotide change (x-axis).

**Supplementary Table 1: Chromothripsis-like events identified in breast carcinomas**

The adjusted  $p$ -value is the Bayesian probability of the fusion being a passenger event and the Bayesian driver probability is the probability of the fusion being a driver event. Fusion events with adjusted  $P < 0.5$  were classified as “driver” fusions.
