

Supplemental Figure S-3. Longitudinal versus cross-sectional age effect on PM incidence in SEER 9 registries (1973-2013) in males age 0-74 (Panel A), males age 75+ (Panel B), females age 0-74 (Panel C) and females age 75+ (Panel D). Changes in net drift are consistent with the opposing slopes for the age 0-74 (negative) versus age 75+ (positive) rate ratios.
