

**Supplementary Table 2.** Sensitivity analysis for identifying risk factors associated with recovery of renal function by hospital discharge including non-survivors to hospital discharge (n=314<sup>+</sup>)

	<b>Odds ratio (OR)</b>	<b>95% Confidence interval</b>	<b>p-value</b>
Age	0.98	0.96-1.00	0.02
Baseline SCr	5.93	1.44-24.37	0.01
AKI on day 1	0.30	0.18-0.53	<0.001
In-hospital RRT	0.14	0.02-0.87	0.03
<p>* Adjusted for presence of chronic kidney disease at baseline            Multi-variable logistic regression is used            †: missing n=10 for variable AKI on day 1. The analytic sample size is n=304.            AKI: acute kidney injury; SCr: serum creatinine; RRT: renal replacement therapy</p>
