

Supplementary Fig. 7: Abundance of 121 TE families (23 TIR, 60 LTR, 37 non-LTR and 1 Foldback) during the hot and cold invasion. Graphs show the fold-increase in reads mapping to each TE family relative to generation 10 (the base population consists solely of females whereas the evolved populations are a mix of males and females, which precludes a comparison of these two datasets). Results are shown for all three replicates (right panel) and two temperature regimes (top panel). Only the P-element (red) shows a pronounced increase in copy numbers; blue: mariner, green: BS
