Supplementary Figures

Supplementary Figure 1

Supplementary Figure 1. Localization of PMJs by free-running PF pacing. Endocardial view of an experimental preparation and corresponding AT map during PF pacing at 1 Hz. Yellow star indicates bipolar free-running PF stimulation and black arrows show activation origins corresponding to PMJs.

Supplementary Figure 2. Conduction velocity before and after the onset of no-flow ischemia. A, Epicardial AT maps during EPI stimulation at 1 Hz, before and after 7 min of no-flow ischemia. Isochrones are 5 ms spacing. CTL=control, ISC=ischemia. **B,** Longitudinal (Cv_L) and transversal (Cv_T) conduction velocity and their ratio from EPI surface when pacing EPI at 1 Hz, in control versus ischemic conditions. **C,** AP traces and corresponding upstrokes extracted from the origin of activation when pacing EPI at 1 Hz, during CTL or ISC. Statistical differences were determined by paired t-tests (*p<0.05).
