**Supplementary table 3. Multiple regression analyses of blood pressure and hemodynamic variables with MBG excretion and the MBG/ $\text{Na}^+$  excretion ratio as the main independent variables in black and white women**

Each dependent variable represents a separate multiple regression analysis adjusted for socio-economic status. All models included the following covariates: socio-economic status; age; waist:height ratio;  $\gamma$ -glutamyl transferase; glycated haemoglobin; total cholesterol: high density lipoprotein cholesterol ratio. cSBP, central systolic blood pressure; MBG, marinobufagenin;  $\text{Na}^+$ , sodium; SBP, systolic blood pressure; TPR, total peripheral resistance.
