## Materials and instruments

Unless otherwise stated, all reagents were purchased from commercial suppliers and used without further purification. The solvents were purified by conventional methods before use. ER-Tracker Red, and Mito-Tracker Deep Red were purchased from Invitrogen (USA). Phorbol 12-myristate 13-acetate (PMA), rotenone, carbonyl cyanide m-chlorophenylhydrazone (CCCP), lipopolysaccharide (LPS) and L-buthionine sulfoximine (BSO) were purchased from Sigma. Nelfinavir was purchased from Aladdin. Tunicamycin (Tm) was purchased from Solarbio Science and Technology. Silica gel (200-300 mesh) used for flash column chromatography was purchased from Qingdao Haiyang Chemical Co., Ltd. **MI-H<sub>2</sub>O<sub>2</sub>** and **ER-H<sub>2</sub>O<sub>2</sub>** were dissolved in dimethyl sulfoxide (DMSO) to produce 1 mM stock solutions. <sup>1</sup>HNMR and <sup>13</sup>CNMR spectra were determined by 300 MHz and 75 MHz using Bruker NMR spectrometers. The mass spectra were obtained by Bruker maxis ultra-high resolution-TOF MS system. The fluorescence spectra measurements were performed using FLS-920 Edinburgh fluorescence spectrometer. Cary eclipse fluorescence spectrophotometer was used for the kinetic assays. Fluorescence imaging in cells were performed with Leica TCS SP5 Confocal Laser Scanning Microscope. The laser power of confocal imaging is 5 mW (405 nm laser) and 15 mW (514, 543 and 633 nm laser). The mouse mammary carcinoma 4T1 cells and human

hepatoma cells (HepG2) were purchased from Cell Bank of the Chinese Academy of Sciences (Shanghai, China).

### Cells culture

Human hepatoma (HepG2) and mouse mammary carcinoma (4T1) cells were cultured in high glucose DMEM (4.5 g of glucose/L) or RPMI 1640 supplemented with 10% fetal bovine serum, 1% penicillin, and 1% streptomycin at 37 °C in a 5% CO<sub>2</sub> /95% air incubator MCO-15AC (SANYO, Tokyo, Japan). One day before imaging, the cells were detached and were replanted on glass-bottomed dishes.

### Determination of the limit of detection

The detection limit was determined from the fluorescence titration data. So the detection limit was calculated with the following equation:  $\text{Detection limit} = 3\sigma/k$ , where  $\sigma$  is the standard deviation of blank measurement,  $k$  is the slope between the fluorescence intensity or fluorescence intensity ratio versus H<sub>2</sub>O<sub>2</sub> concentration.

**Scheme S1** Synthesis of **MI-H<sub>2</sub>O<sub>2</sub>**

**Scheme S2** Synthesis of **ER-H<sub>2</sub>O<sub>2</sub>**

Synthesis of compound **Mcy-OH** and probe **MI-H<sub>2</sub>O<sub>2</sub>**

Compound **Mcy-OH**: Under the Ar gas condition, 2,3,3-trimethyl-1-ethyl-3H-indolium iodide<sup>[1]</sup> (0.315 g, 1 mmol) and 4-hydroxybenzaldehyde (146.5 mg, 1.2 mmol), sodium acetate (0.25 g, 3.0 mmol) were dissolved in 10 mL of acetic anhydride. The mixture was stirred at 55°C for 2 h. Then the solvents were dropped in ethyl ether, and the residue was purified by silica gel chromatography with dichloromethane/methanol (10:1 v/v) to give **MCy-OH** as a red solid (0.27 g, 64 %). <sup>1</sup>H NMR (300 MHz, *d6*-DMSO) δ(ppm): 1.430 (s, 3H), 1.784 (s, 6H), 4.655 (s, 2H), 6.949 (s, 2H), 7.428 (d, *J*=10.8 Hz, 1H), 7.589 (s, 2H), 7.861 (s, 2H), 8.166 (s, 2H), 8.383 (d, *J*=10.8 Hz, 1H). <sup>13</sup>C NMR (75 MHz, *d6*-DMSO) δ(ppm): 14.0, 26.5, 41.9, 52.2, 108.6, 114.9,

117.2, 123.5, 126.3, 129.1, 129.5, 134.5, 141.0, 144.0, 154.9, 164.7, 181.1. HRMS (ESI)  $m/z$  calcd. for  $C_{20}H_{22}NO^+$  292.1696, found 292.1646.

Probe **MI-H<sub>2</sub>O<sub>2</sub>**: Compound **MCy-OH** (0.21 g, 0.5 mmol) and 4-(bromomethyl)phenylboronic acid (0.10 g, 0.5 mmol), potassium carbonate (0.138 g, 1.0 mmol) were dissolved in 15 mL acetonitrile. The mixture was stirred at 80°C for 6 h under the Ar gas condition. The residue was purified by silica gel chromatography with dichloromethane/methanol (20:1 v/v) to give **MI-H<sub>2</sub>O<sub>2</sub>** as a light yellow solid (0.12 g, 43 %). <sup>1</sup>H NMR (300 MHz, *d*<sub>6</sub>-DMSO)  $\delta$ (ppm): 1.426 (t,  $J=6.9$  Hz, 3H), 1.774 (s, 6H), 4.657 (q,  $J=6.9$  Hz, 2H), 5.276 (s, 2H), 7.248 (d,  $J=9.0$  Hz, 2H), 7.441 (d,  $J=7.8$  Hz, 2H), 7.586 (m, 3H), 7.822 (d,  $J=7.8$  Hz, 2H), 7.870 (m, 2H), 8.052 (s, 2H), 8.250 (d,  $J=9.0$  Hz, 2H), 8.455 (d,  $J=16.2$  Hz, 1H). <sup>13</sup>C NMR (75 MHz, *d*<sub>6</sub>-DMSO)  $\delta$ (ppm): 14.1, 26.3, 42.3, 52.5, 70.3, 110.3, 115.3, 116.2, 123.6, 127.2, 128.0, 129.6, 133.8, 134.8, 138.5, 140.9, 144.2, 154.5, 163.5, 181.7. HRMS (ESI)  $m/z$  calcd. for  $C_{27}H_{29}BNO_3^+$  426.2239, found 426.2315.

#### Synthesis of **ER-NapBr** and probe **ER-H<sub>2</sub>O<sub>2</sub>**

Compound **ER-NapBr**: Under the Ar gas condition, compound **1**<sup>[2]</sup> (0.43 g, 2 mmol) and 4-bromo-1,8-naphthalic anhydride (0.56 g, 2 mmol) were dissolved in 20 mL ethanol. The reaction was heated to 80°C for 8 h. The mixture was poured into 40 mL distilled deionized water, and the solid was filtered and purified by column chromatography with  $CH_2Cl_2$ :

CH<sub>3</sub>OH=20:1 as the eluent. Compound **ER-NapBr** (0.38 g, 40% yield) was obtained as a grey white solid. <sup>1</sup>H NMR (300 MHz, *d6*-DMSO) δ(ppm): 2.235 (s, 3H), 3.096 (s, 2H), 4.086 (s, 2H), 7.200 (s, 2H), 7.563 (s, 2H), 7.766 (s, 1H), 7.953 (s, 1H), 8.226 (d, *J*=15.9 Hz, 2H), 8.479 (s, 2H). <sup>13</sup>C NMR (75 MHz, *d6*-DMSO) δ(ppm): 19.0, 21.3, 56.5, 122.5, 123.3, 126.8, 128.8, 129.2, 129.5, 129.9, 130.2, 131.3, 131.7, 131.9, 132.9, 138.2, 142.9, 163.3, 163.4. HRMS (ESI) *m/z* calcd. for C<sub>21</sub>H<sub>17</sub>BrN<sub>2</sub>O<sub>4</sub>S [M+Na<sup>+</sup>]: 494.9985, 496.9965, found 494.9982, 496.9959

Probe **ER-H<sub>2</sub>O<sub>2</sub>**: In an atmosphere of argon, to a mixture of compound **ER-NapBr** (0.24 mg, 0.5 mmol, 1.0 equiv.) in ethanol and toluene (v/v 1:1, 20 mL) was added Pd(dppf)Cl<sub>2</sub> (36.4 mg, 0.05 mmol, 0.1 equiv.), potassium acetate (147 mg, 1.5 mmol, 3.0 equiv.), and bis(pinacolato)-diboron (356 mg, 1.0 mmol, 2.0 equiv.). The reaction mixture was stirred for 10 h at 85 °C in an oil bath. H<sub>2</sub>O (20 mL) was added and the mixture was extracted with 20 mL of CH<sub>2</sub>Cl<sub>2</sub> thrice. The combined extracts were dried over Na<sub>2</sub>SO<sub>4</sub>. Concentration of the product and chromatography were carried out over silica gel (50:1 CH<sub>2</sub>Cl<sub>2</sub>:CH<sub>3</sub>OH). This resulted in 91 mg (yield 35%) of **ER-H<sub>2</sub>O<sub>2</sub>** as a light yellow solid. <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>) δ (ppm): 1.466 (s, 12H), 1.859 (s, 3H), 3.493 (q, *J*=5.1 Hz, 2H), 4.272 (t, *J*=5.1 Hz, 2H), 5.167 (t, *J*=4.8 Hz, 1H), 6.658 (d, *J*=8.1 Hz, 2H), 7.506 (d, *J*=8.1 Hz, 2H), 7.772 (m, 1H), 8.312 (d, *J*=7.2 Hz, 1H),

8.473 (m, 2H), 9.156 (d,  $J=8.4$  Hz, 1H).  $^{13}\text{C}$  NMR (75 MHz,  $\text{CDCl}_3$ )  $\delta$ (ppm): 21.1, 24.9, 39.1, 42.5, 84.7, 122.0, 124.0, 126.6, 127.1, 127.7, 129.1, 129.9, 131.1, 134.3, 135.1, 135.3, 135.7, 137.0, 142.6, 164.6, 164.7. HRMS (ESI)  $m/z$  calcd. for  $\text{C}_{27}\text{H}_{29}\text{BN}_2\text{O}_6\text{S}$  [ $\text{M}+\text{Na}^+$ ]: 543.1736, found 543.1727.

**Figure S1** (A) The fluorescence intensity changes of **MI- $\text{H}_2\text{O}_2$**  with different concentrations of  $\text{H}_2\text{O}_2$  (0-40  $\mu\text{M}$ ). (B) and (C) were two linear regressions between fluorescence intensity and  $\text{H}_2\text{O}_2$  concentration. There is a good linear correlation in the range of 0.5-15  $\mu\text{M}$   $\text{H}_2\text{O}_2$  ( $y=553.14x+1249.42$ ,  $R^2=0.9925$ ) and 15-40  $\mu\text{M}$   $\text{H}_2\text{O}_2$  ( $y=169.23x+6915.80$ ,  $R^2=0.9805$ ).

**Figure S2** (A) The fluorescence intensity ratio  $F_{558}/F_{458}$  of ER- $H_2O_2$  with different concentrations of  $H_2O_2$  (0-200  $\mu M$ ). (B) The good linearity between ratio  $F_{558}/F_{458}$  and  $H_2O_2$  concentration in the range of 0-40  $\mu M$ .

**Figure S3** (A) The fluorescence responses of MI- $H_2O_2$  with various ROS ( $H_2O_2$ : 50  $\mu M$ , other ROS: 100  $\mu M$ ). (B) The fluorescence spectra of MI- $H_2O_2$  with different metal ions (Na $^+$ , K $^+$ : 5 mM; Ca $^{2+}$ , Mg $^{2+}$ : 500  $\mu M$ ; Zn $^{2+}$ , Al $^{3+}$ , Fe $^{3+}$ , Cu $^{2+}$ , Mn $^{2+}$ : 200  $\mu M$ ;  $H_2O_2$ : 50  $\mu M$ ).  $E_x=525$  nm.

**Figure S4** (A) The fluorescence intensity ratio  $F_{558}/F_{458}$  of **ER- $H_2O_2$**  with various ROS ( $H_2O_2$ : 50  $\mu$ M, other ROS: 100  $\mu$ M). (B) The fluorescence spectra of **ER- $H_2O_2$**  with different metal ions ( $Na^+$ ,  $K^+$ : 5 mM;  $Ca^{2+}$ ,  $Mg^{2+}$ : 500  $\mu$ M;  $Zn^{2+}$ ,  $Al^{3+}$ ,  $Fe^{3+}$ ,  $Cu^{2+}$ ,  $Mn^{2+}$ : 200  $\mu$ M;  $H_2O_2$ : 50  $\mu$ M).  $E_x=400$  nm.

### Kinetic Studies:

The kinetic profiles of the reaction were performed under *pseudo*-first-order conditions with a large excess of  $H_2O_2$  (100 equiv.) over probes **MI- $H_2O_2$**  and **ER- $H_2O_2$**  at room temperature. The *pseudo*-first-order rate constant  $k'$  for the reaction was calculated to be  $4.35 \times 10^{-3} \text{ S}^{-1}$  and  $2.35 \times 10^{-3} \text{ S}^{-1}$  for **MI- $H_2O_2$**  and **ER- $H_2O_2$**  respectively according to eqn (1):

$$\ln [(F_{\max} - F_t)/F_{\max}] = -k' t \quad (1)$$

Where  $F_t$  and  $F_{\max}$  are the fluorescence intensities at time  $t$  and the maximum value obtained after the reaction was complete (555 nm for **MI- $H_2O_2$**  and 558 nm for **ER- $H_2O_2$** ).  $k'$  is the pseudo-first-order rate

constant.

**Figure S5** Fluorescence responses of  $10 \mu\text{M}$   $\text{MI-H}_2\text{O}_2$  (A, B) and  $\text{ER-H}_2\text{O}_2$  (C, D) to  $1 \text{ mM}$   $\text{H}_2\text{O}_2$  with excitation at  $525 \text{ nm}$  and  $400 \text{ nm}$ , respectively. The  $k' = 4.35 \times 10^{-3}$  and  $2.35 \times 10^{-3} \text{ s}^{-1}$  for  $\text{MI-H}_2\text{O}_2$  and  $\text{ER-H}_2\text{O}_2$  were obtained from slope of the plot of  $\ln [(F_{\text{max}} - F_t)/F_{\text{max}}]$  to time (measured at  $555 \text{ nm}$  for  $\text{MI-H}_2\text{O}_2$  and  $558 \text{ nm}$  for  $\text{ER-H}_2\text{O}_2$ ).

**Figure S6** The photostability experiments of **MI-H<sub>2</sub>O<sub>2</sub>** and **ER-H<sub>2</sub>O<sub>2</sub>** with H<sub>2</sub>O<sub>2</sub>. (A) The changes for fluorescence intensity of **MI-H<sub>2</sub>O<sub>2</sub>** at 555 nm when excited with 525 nm. (B) The changes for fluorescence intensity of **ER-H<sub>2</sub>O<sub>2</sub>** at 558 nm when excited with 400 nm. Cary eclipse fluorescence spectrophotometer was used for these assays.

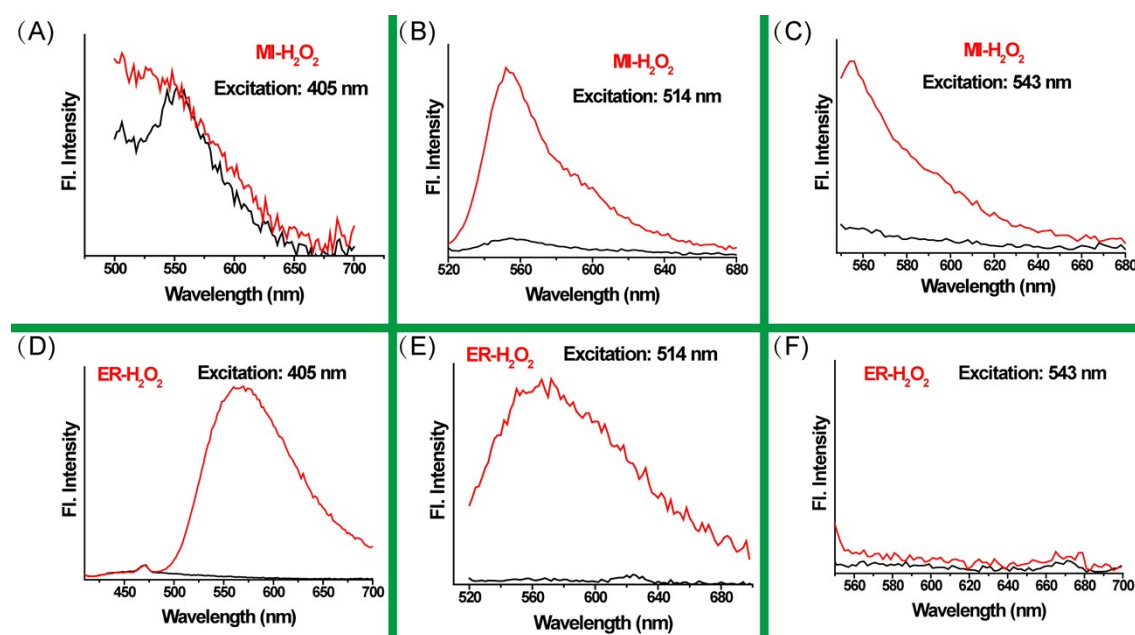

**Figure S7** Confocal fluorescence images of 4T1 cells stained with **MI-H<sub>2</sub>O<sub>2</sub>** (A-C) and **ER-H<sub>2</sub>O<sub>2</sub>** (D-F) with commercial organelle dyes. (A) Fluorescence image of **MI-H<sub>2</sub>O<sub>2</sub>** (10  $\mu$ M) in cells treated with 200  $\mu$ M H<sub>2</sub>O<sub>2</sub> for 60 min (green channel, Ex=514 nm, collected 520-580 nm) and (B) 0.5  $\mu$ M Mito-Tracker Deep Red (red channel, Ex=633 nm, collected 640-700 nm). (C) Overlay of (A) and (B). Scale bar: 5  $\mu$ m. (D)

Fluorescence image of **ER-H<sub>2</sub>O<sub>2</sub>** (10  $\mu$ M) in cells treated with 200  $\mu$ M H<sub>2</sub>O<sub>2</sub> for 60 min (green channel, Ex=405 nm, collected 500-620 nm) and (E) 0.5  $\mu$ M ER-Tracker Red (red channel, Ex=543 nm, collected 580-630 nm). (F) Overlay of (D) and (E). Scale bar: 10  $\mu$ m.

**Figure S8** The MTT assays of **MI-H<sub>2</sub>O<sub>2</sub>** (A) and **ER-H<sub>2</sub>O<sub>2</sub>** (B) at different concentrations.

**Figure S9** The fluorescence spectra of **ER-H<sub>2</sub>O<sub>2</sub>** and **MI-H<sub>2</sub>O<sub>2</sub>** with

H<sub>2</sub>O<sub>2</sub> under different excitation wavelengths (405, 514 543 nm). (A-C) The fluorescence spectra of **MI-H<sub>2</sub>O<sub>2</sub>** with H<sub>2</sub>O<sub>2</sub> under excitation of 405 nm (A), 514 nm (B) and 543 nm (C), respectively. (D-F) The fluorescence spectra of **ER-H<sub>2</sub>O<sub>2</sub>** with H<sub>2</sub>O<sub>2</sub> under excitation of 405 nm (D), 514 nm (E) and 543 nm (F), respectively. The fluorescence enhancements of the two probes can be easily excited by 514 nm, which will lead the intense spectral overlap for confocal fluorescence imaging. To completely avoid the spectral overlap for confocal fluorescence imaging, we chose 543 nm as excitation wavelength for **MI-H<sub>2</sub>O<sub>2</sub>**. It is because **ER-H<sub>2</sub>O<sub>2</sub>** can't be excited at 543 nm, but can be easily excited by 405 nm. In stark contrast, fluorescence enhancement of **MI-H<sub>2</sub>O<sub>2</sub>** to H<sub>2</sub>O<sub>2</sub> can be readily excited by 543 nm but not 405 nm.

**Figure S10** Confocal fluorescence images of live HepG2 cells stained with **MI-H<sub>2</sub>O<sub>2</sub>** and **ER-H<sub>2</sub>O<sub>2</sub>** under stimulus. (A1-A2) Cells incubated with PBS for 1 h and then stained with **MI-H<sub>2</sub>O<sub>2</sub>** (10  $\mu$ M) for 1 h. (A3-A4) Cells incubated with PMA (100  $\mu$ g/mL) for 1 h and then stained with **MI-H<sub>2</sub>O<sub>2</sub>** (10  $\mu$ M) for 1 h. Ex=514 nm, collected 520-580 nm. Scare bar:

20  $\mu\text{m}$ . (B1-B4) Cells incubated with DMSO (1%) for 8 h and then stained with **ER-H<sub>2</sub>O<sub>2</sub>** for 1 h. (B5-B8) Cells incubated with Tm (20  $\mu\text{g}/\text{mL}$ ) for 8 h and then stained with **ER-H<sub>2</sub>O<sub>2</sub>** for 1 h. Ex=405 nm, collected 430-470 nm for blue channel, 500-620 nm for green channel. Scare bar: 20  $\mu\text{m}$ .

**Figure S11** The ratiometric fluorescence imaging of **ER-H<sub>2</sub>O<sub>2</sub>** in 4T1 cells treated with Tm. 4T1 cells were incubated with 10  $\mu\text{M}$  **ER-H<sub>2</sub>O<sub>2</sub>** for 1 h, and then were treated with 25  $\mu\text{g}/\text{mL}$  Tm over a period of 2.5 h. Obviously, the fluorescence intensity in green channel (500-620 nm) at 150 min was higher than that at 0 min. And the ratio between green to blue channel was increased with time. Ex=405 nm. Scare bar: 20  $\mu\text{m}$ .

**Figure S12** The confocal fluorescence imaging of **ER-H<sub>2</sub>O<sub>2</sub>** (10  $\mu$ M) with addition of 10 mM DTT. The green channel displayed distinguishable and increasing fluorescence intensity over time. Ex=405 nm. Scare bar: 50  $\mu$ m

**Figure 13** Confocal fluorescence images of live HepG2 cells stained with **ER-H<sub>2</sub>O<sub>2</sub>** (10  $\mu$ M) in the presence of nelfinavir (200  $\mu$ g/mL) at 0 and 160 min. (A) and (E) were blue channel collected 430-470 nm. (B) and (F) were green channel collected 500-620 nm. (C) and (G) were ratiometric

images between green and blue channel. (D) and (H) were bright-field images. The yellow and red arrows indicated the striking morphologic changes of two cells. Ex=405 nm. Scale bar: 20  $\mu\text{m}$ .

**Figure S14** Confocal fluorescence images of 4T1 cells stained with **ER- $\text{H}_2\text{O}_2$**  (10  $\mu\text{M}$ ) in the presence of nelfinavir (200  $\mu\text{g}/\text{mL}$ ) at 0 and 130 min. (A) and (E) were blue channel collected 430-470 nm. (B) and (F) were green channel collected 500-620 nm. (C) and (G) were ratiometric images between green and blue channel. (D) and (H) were bright-field images. The yellow and red arrows indicated the striking morphologic changes of two cells. Ex=405 nm. Scale bar: 25  $\mu\text{m}$ .

**Figure S15** (A) Confocal fluorescence images of HepG2 cells stained with ER-  $\text{H}_2\text{O}_2$  and MI- $\text{H}_2\text{O}_2$  (10  $\mu\text{M}$ ) in the presence of BSO (10 mM) at different time. (A-B) Fluorescence image of ER- $\text{H}_2\text{O}_2$  collected 500-620 nm (Ex=405 nm). (C-D) Fluorescence image of MI- $\text{H}_2\text{O}_2$  collected 550-600 nm (Ex=543 nm). (E-F) The bright-field images. (G) The output of average intensity in A-D. Scale bar: 25  $\mu\text{m}$ .

**Figure S16** (A) Confocal fluorescence images of HepG2 cells stained

with **ER-H<sub>2</sub>O<sub>2</sub>** and **MI-H<sub>2</sub>O<sub>2</sub>** (10 μM) in the presence of rotenone (100 μM) at different time. The first row (green channel) was fluorescence images for **ER-H<sub>2</sub>O<sub>2</sub>** collected 500-620 nm by the excitation at 405 nm. The second row (red channel) was fluorescence images for **MI-H<sub>2</sub>O<sub>2</sub>** collected 550-600 nm by the excitation at 543 nm. The third row was bright-field images. (B) The output of average fluorescence intensity changes in image A at different time. Scale bar: 50 μm.
