

Supplemental Figure S2 – A) Examples of trans interactions: chromosomal regions that were separated more recently show similar interactions with other chromosomes. A strong inter-chromosomal interaction appearing like a strong band was identified between NLE6 and NLE7, indicative of a small translocation or assembly error. B) Similar to what observed in gibbon, strong signals of inter-chromosomal chromatin contacts, suggesting translocations and/or issues with the genome assembly were detected in rhesus, rabbit, and dog.
