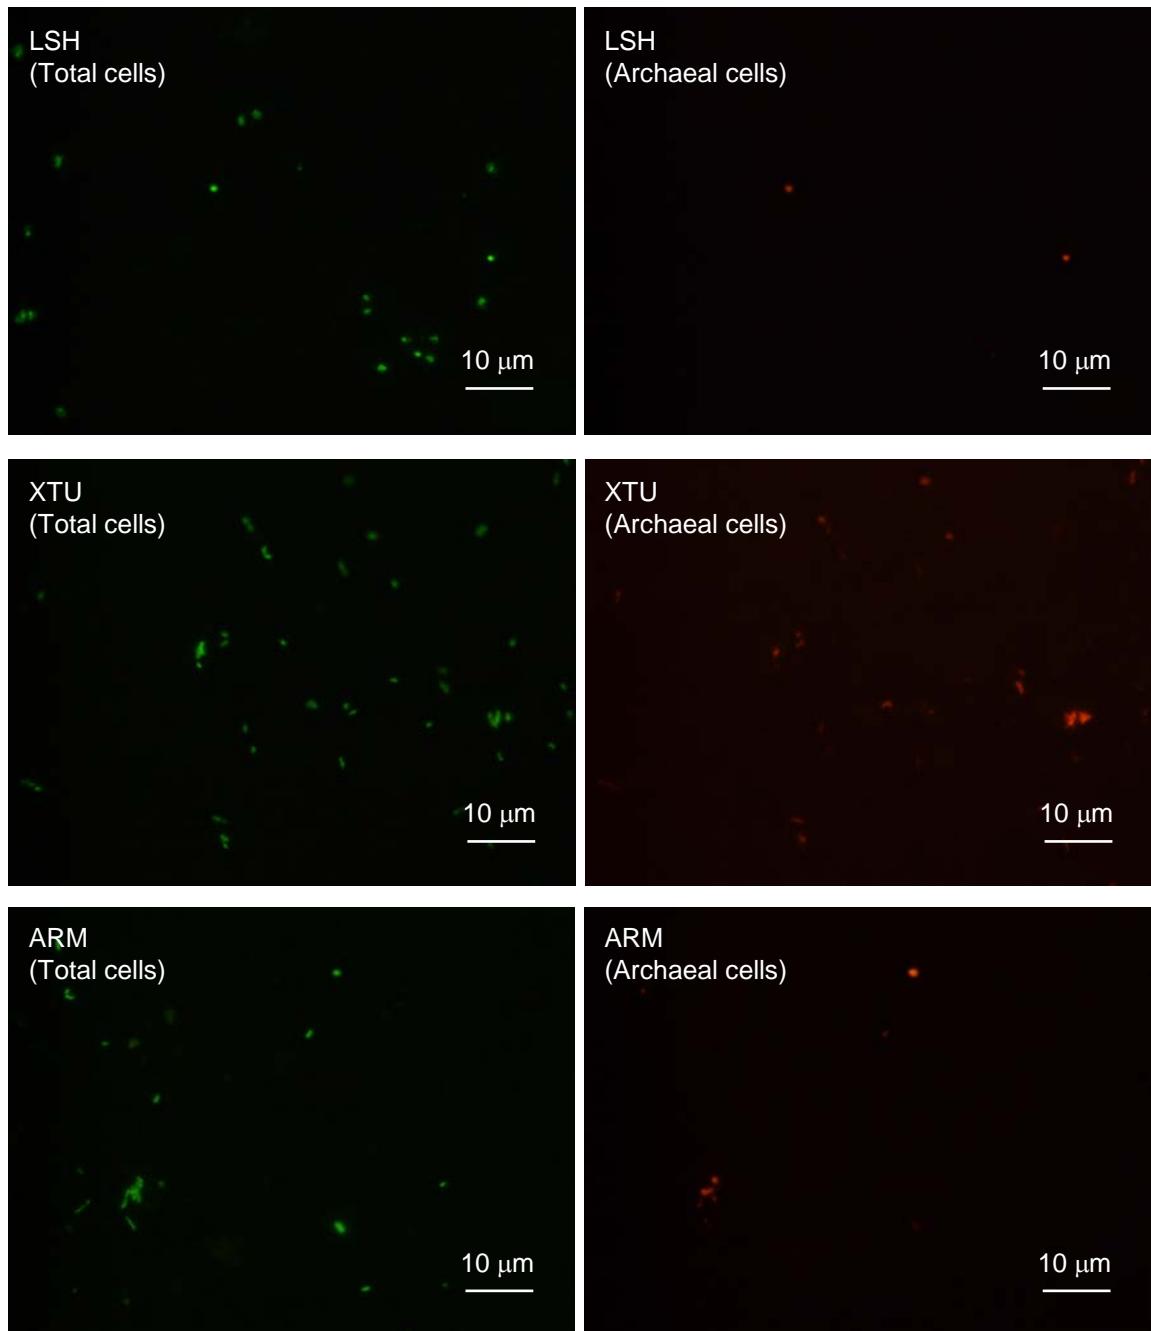

Fig. S1. Photomicrographs of FISH-positive archaeal cells in anaerobic groundwater samples. Each double panel shows identical fields and depicts total microbial cells counterstained with SYBR Green I (green) and FISH-positive cells stained with Cy3 (red) hybridized with ARCH915 (specific for the 16S rRNA of domain *Archaea*).

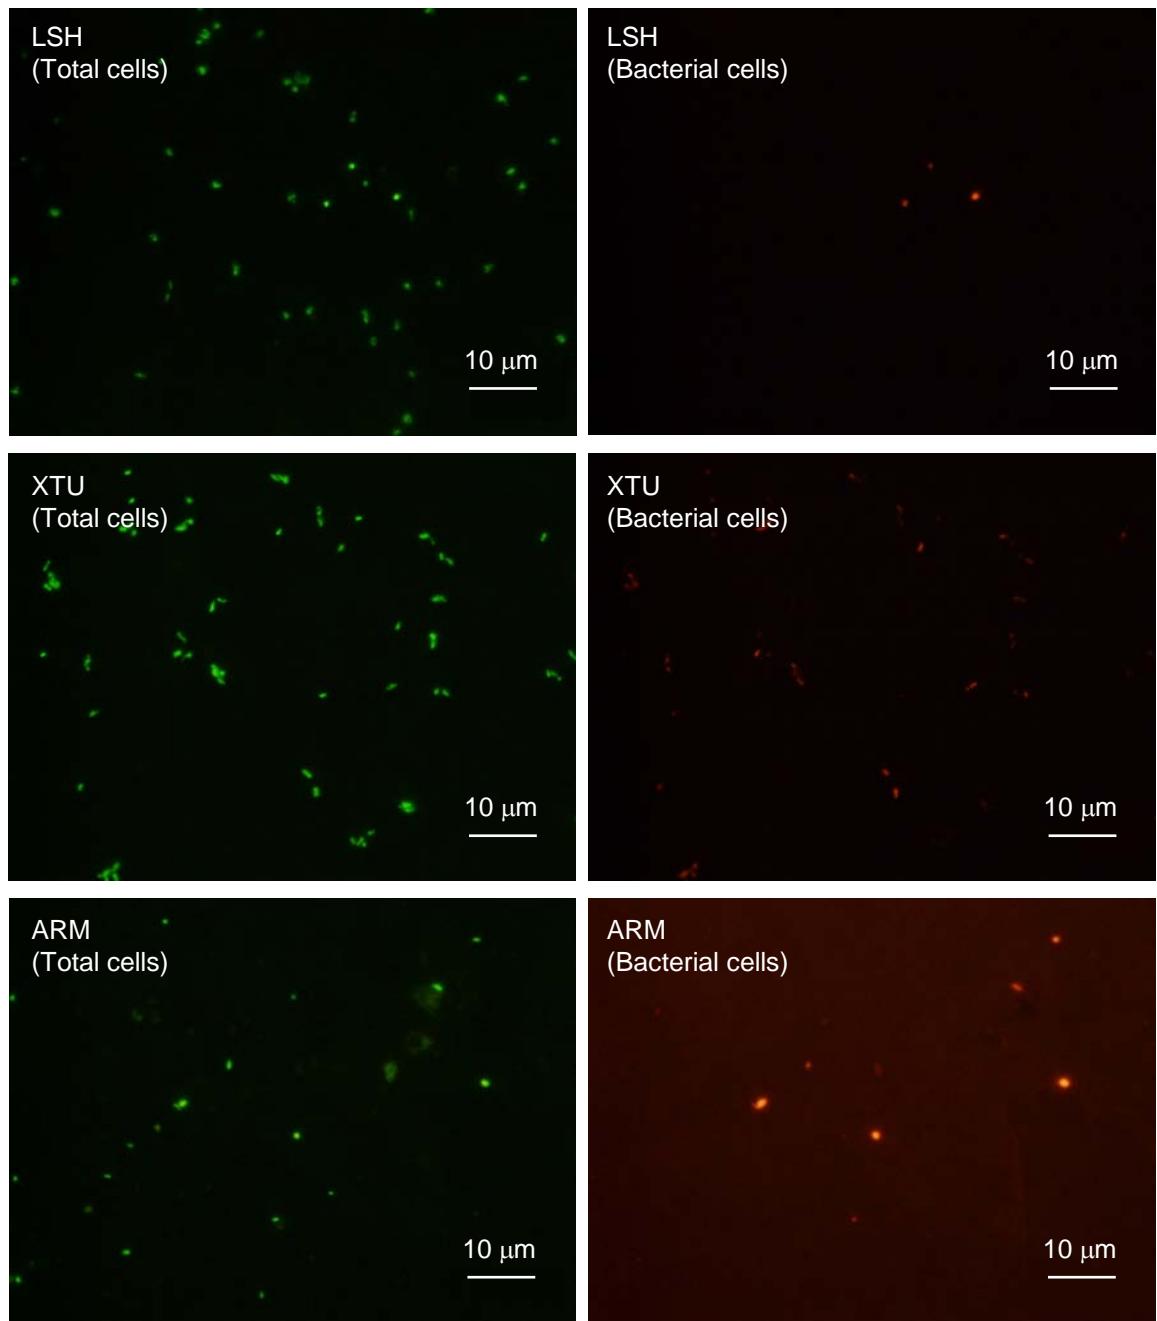

Fig. S2. Photomicrographs of FISH-positive bacterial cells in anaerobic groundwater samples. Each double panel shows identical fields and depicts total microbial cells counterstained with SYBR Green I (green) and FISH-positive cells stained with Cy3 (red) hybridized with EUB338 (specific for the 16S rRNA of domain *Bacteria*).

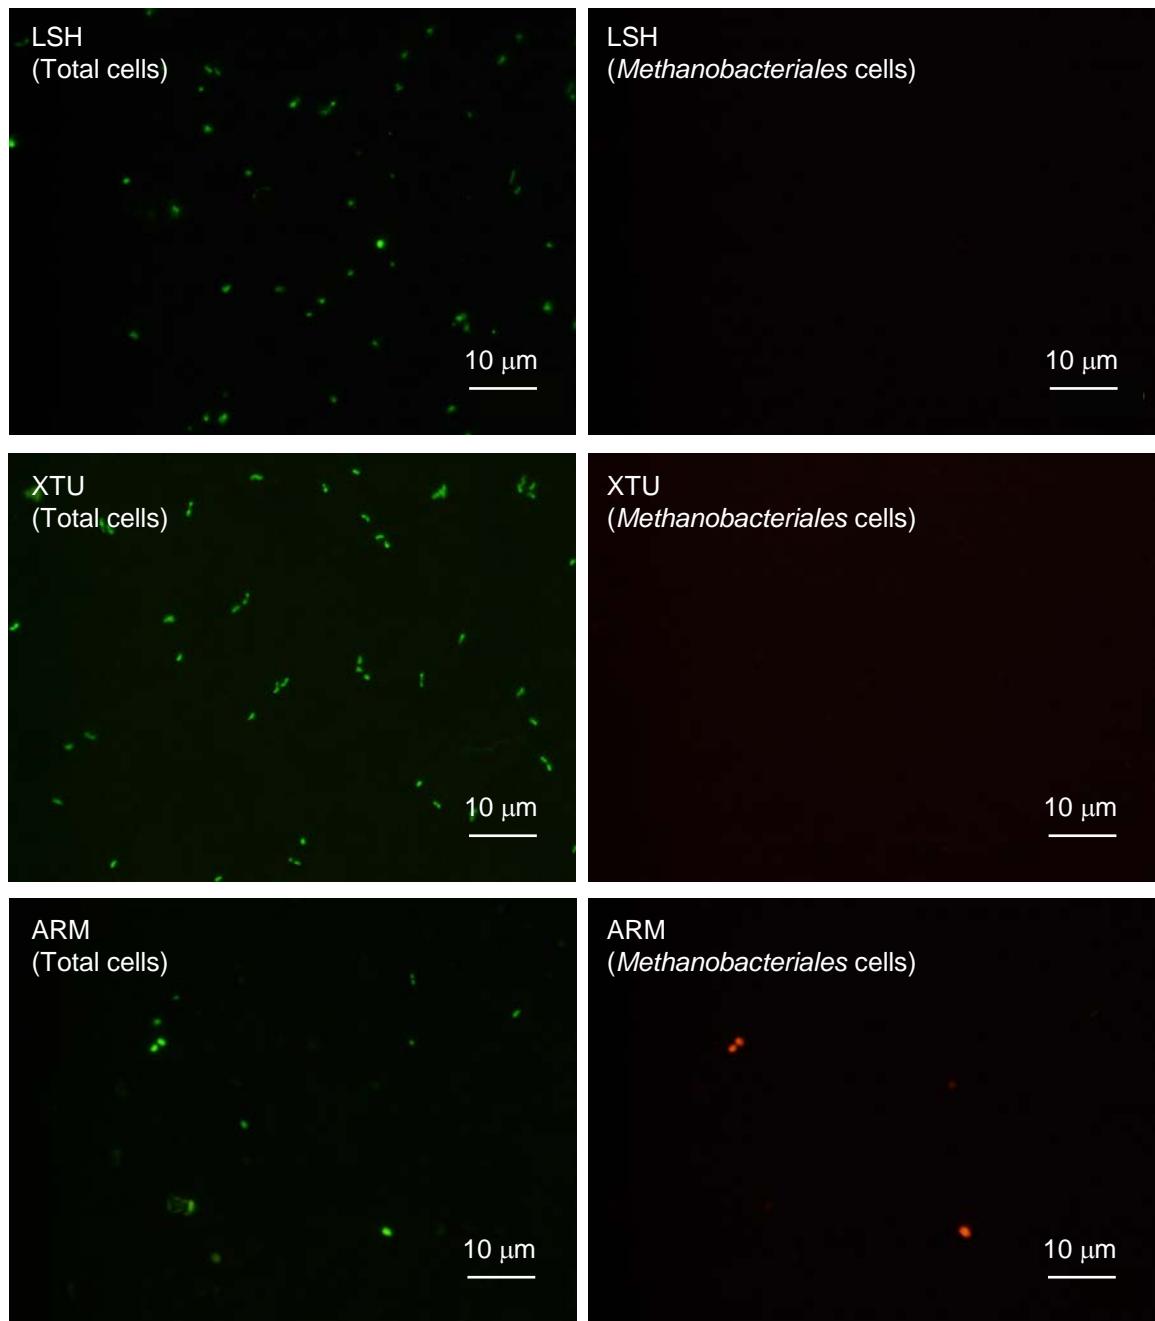

Fig. S3. Photomicrographs of FISH-positive *Methanobacteriales* cells in anaerobic groundwater samples. Each double panel shows identical fields and depicts total microbial cells counterstained with SYBR Green I (green) and FISH-positive cells stained with Cy3 (red) hybridized with MB1174 (specific for the 16S rRNA of the archaeal members of the order *Methanobacteriales*).

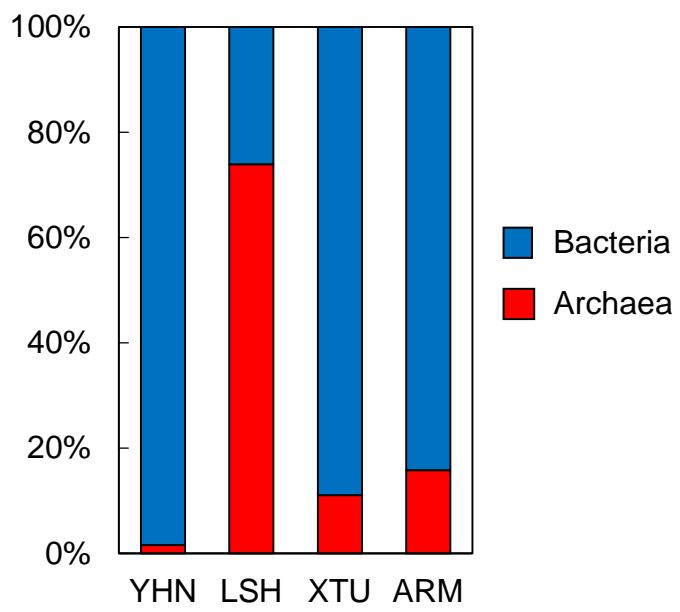

Fig. S4. Percent relative abundance of archaeal and bacterial 16S rRNA genes obtained from NGS analysis.

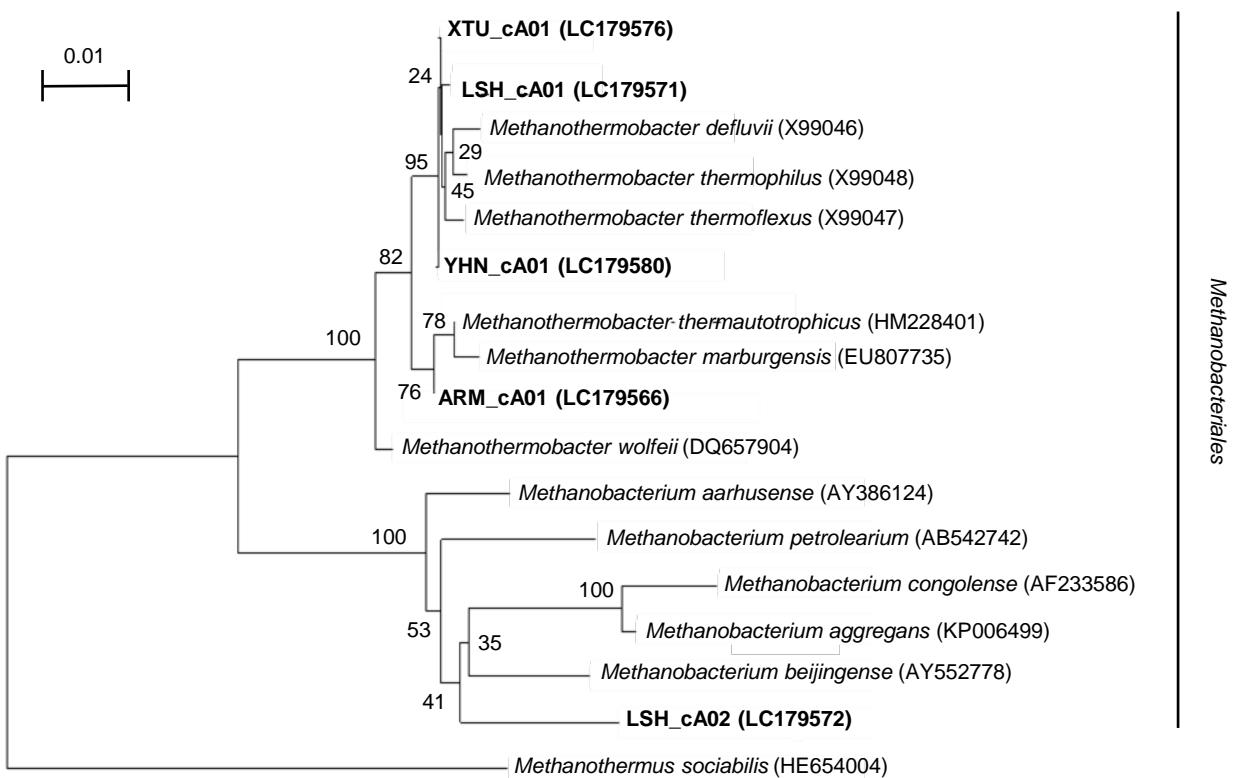

Fig. S5. Neighbor-joining tree of archaeal 16S rRNA gene sequences derived from the cultures using YPG medium-amended groundwater. The 5 OTUs obtained in this study are shown with their relatives. Accession numbers are shown in parentheses. Bootstrap values determined from 1,000 iterations are indicated at the branching points. The sequence of *Methanothermus sociabilis* was used as the outgroup to root the tree. The scale bar represents 1 substitution per 100 nucleotides.

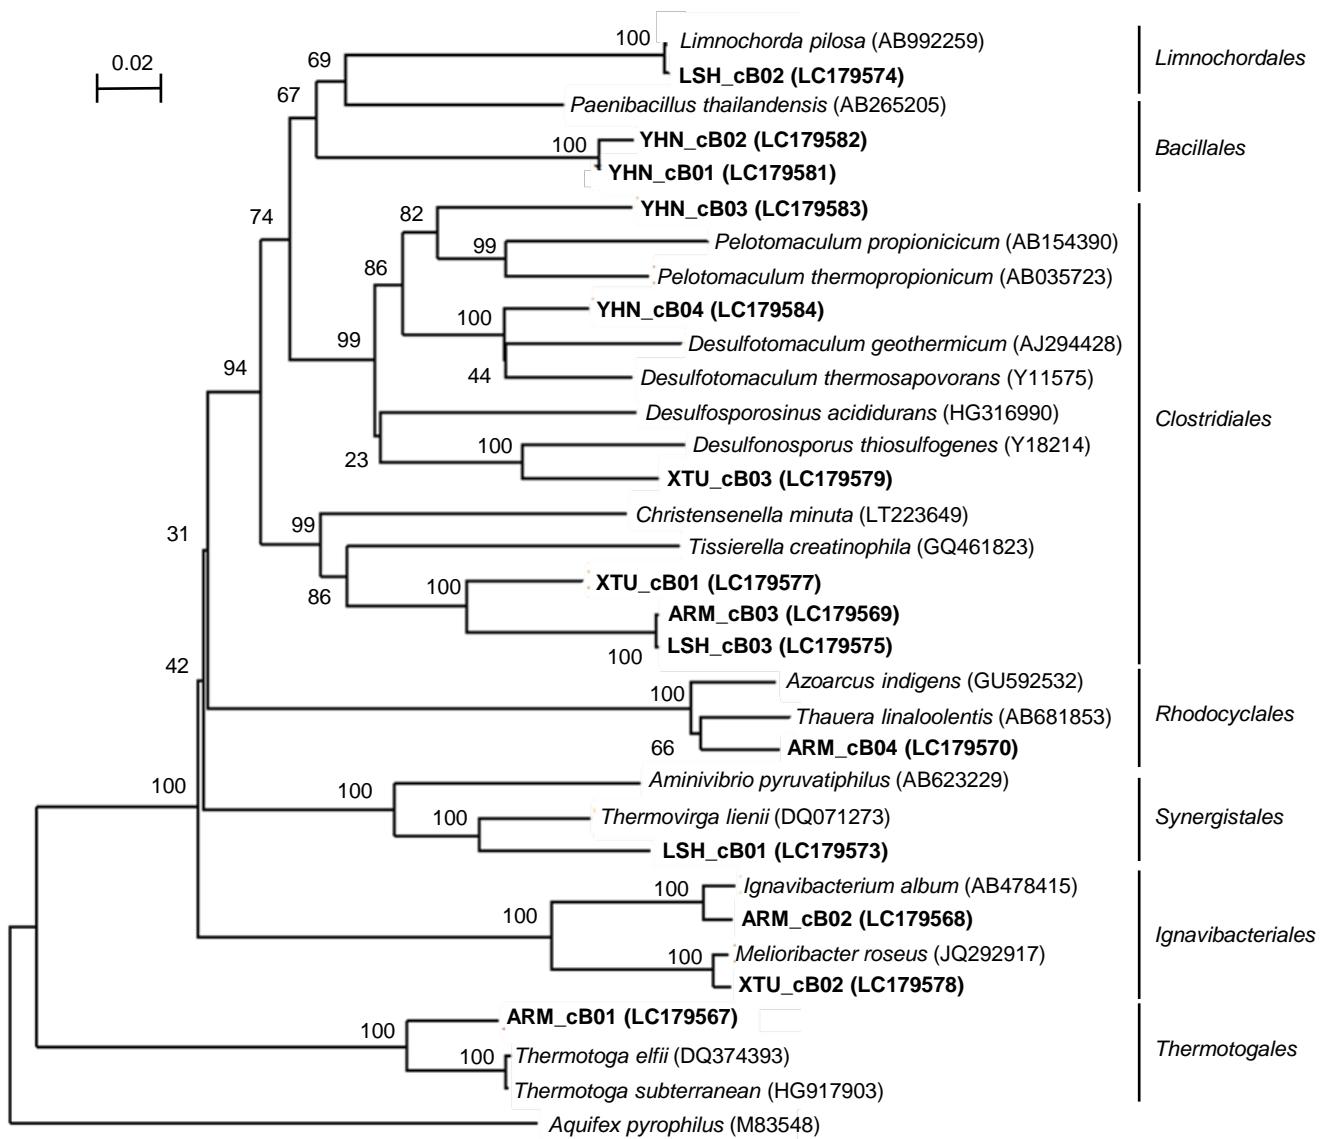

Fig. S6. Neighbor-joining tree of bacterial 16S rRNA gene sequences derived from the cultures using YPG medium-amended groundwater. The 14 OTUs obtained in this study are shown with their relatives. Accession numbers are shown in parentheses. Bootstrap values determined from 1,000 iterations are indicated at the branching points. The sequence of *Aquifex pyrophilus* was used as the outgroup to root the tree. The scale bar represents 2 substitutions per 100 nucleotides.
