

Figure S1

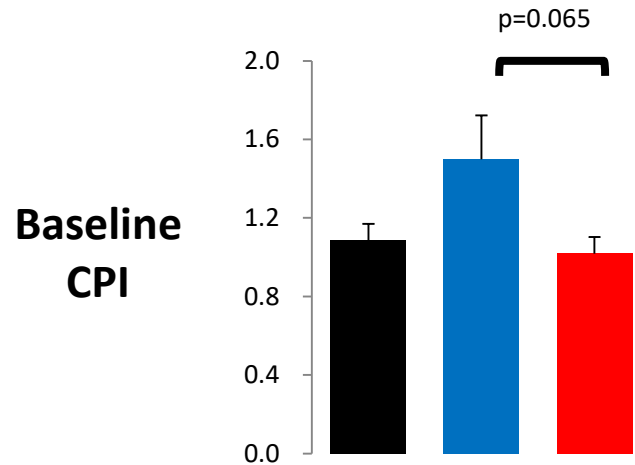

Figure S1. Comparison of C-peptide index (CPI) between patients with HbA1c <7% and those with HbA1c ≥7% at 54 weeks in 49 patients, including 12 who were originally excluded due to receiving additional OADs or bolus insulin. Black bar, all subjects (n=49); Blue bar, patients with HbA1c <7% at 54 weeks (n=7); and Red bar, patients with HbA1c ≥7% at 54 weeks or those receiving additional OADs or bolus insulin during the 54 weeks (n=42). Each value represents the mean ± SEM. A P-value was calculated by the Mann-Whitney U-test.
