

**Supplemental Table 2.** Anthropometric and metabolic parameters of the male cohort according to body mass index (BMI) classes. Non-italicized data show the mean±SD values of the parameters; italicized data show the P values (sign of the coefficients) of the effects evaluated by means of two-way ANOVA. Significant P values are reported in bold

NW: normal weight; OW: overweight; OB: obese; SBP: systolic blood pressure; DBP: diastolic blood pressure; HOMA-IR: homeostatic model assessment – insulin resistance; HDL: high density lipoprotein.

<sup>†</sup> One-way ANOVA. <sup>§</sup> Effect of BMI on anthropometric and metabolic parameters. Positive effect (+): values increased with increasing BMI classes; negative effect (-): values decreased with increasing BMI classes. \* Effect of age on anthropometric and metabolic parameters. Positive effect (+): values increased with age; negative effect (-): values decreased with age. <sup>§</sup> Interaction between BMI and age effects on anthropometric and metabolic parameters. Positive interaction (+): the positive (or negative) effect of age increased (or decreased) with BMI (i.e., the positive (or negative) effect of BMI increased (or decreased) with age). Negative interaction (-): the positive (or negative) effect of age decreased (or increased) with BMI (i.e., the positive (or negative) effect of BMI decreased (or increased) with age).
