¹PPD: product of the perpendicular diameters in cm²; ² Classification for the level of restriction of lesions seen on EADC maps: 0 = no increased restriction (~signal from muscle tissue adjacent to the pelvis), 1 = increased restriction, but less than signal for diffuse infiltration at lumbar spine, 2 = equal to signal at lumbar spine, 3 = above signal at lumbar spine; ³ Presentation of lesions on PET-CT: + = FDG avid lesion; ST = no focal hypermetabolism but soft tissue tumor in the CT portion of the PET-CT; - = PET-CT negative

Supplementary Table 2. Univariate analysis of risk factors for outcome in newly diagnosed patients.

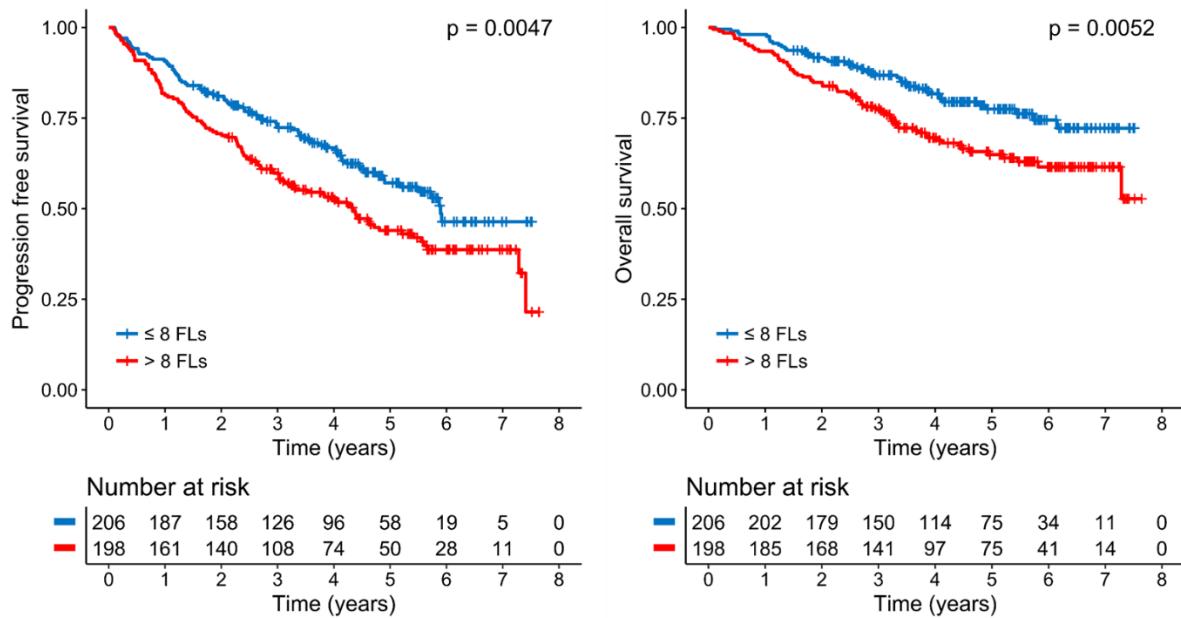

| Variable | | PFS | | | | OS | | |
|------------------|------|------------|-----------|---------------|----------|-----------|---------------|----------|
| | | No. | HR | 95% CI | p | HR | 95% CI | p |
| FL-HiR | no | 348 | | | | | | |
| | yes | 56 | 3.00 | 2.14 to 4.19 | <0.001 | 3.02 | 1.97 to 4.62 | <0.001 |
| FL Number | ≤8 | 206 | | | | | | |
| | >8 | 198 | 1.51 | 1.13 to 2.1 | 0.005 | 1.72 | 1.17 to 2.54 | 0.006 |
| GEP70 | low | 349 | | | | | | |
| | high | 55 | 2.84 | 2.01 to 4.01 | <0.001 | 4.48 | 3.00 to 6.69 | <0.001 |
| R-ISS | I | 76 | | | | | | |
| | II | 277 | 2.53 | 1.55 to 4.14 | <0.001 | 3.24 | 1.49 to 7.02 | 0.003 |
| | III | 46 | 4.13 | 2.30 to 7.41 | <0.001 | 8.45 | 3.66 to 19.49 | <0.001 |
| EMD | no | 381 | | | | | | |
| | yes | 23 | 2.29 | 1.39 to 3.78 | 0.001 | 3.78 | 2.19 to 6.53 | <0.001 |
| gain(1q) | no | 236 | | | | | | |
| | yes | 136 | 1.96 | 1.46 to 2.64 | <0.001 | 2.74 | 1.84 to 4.08 | <0.001 |

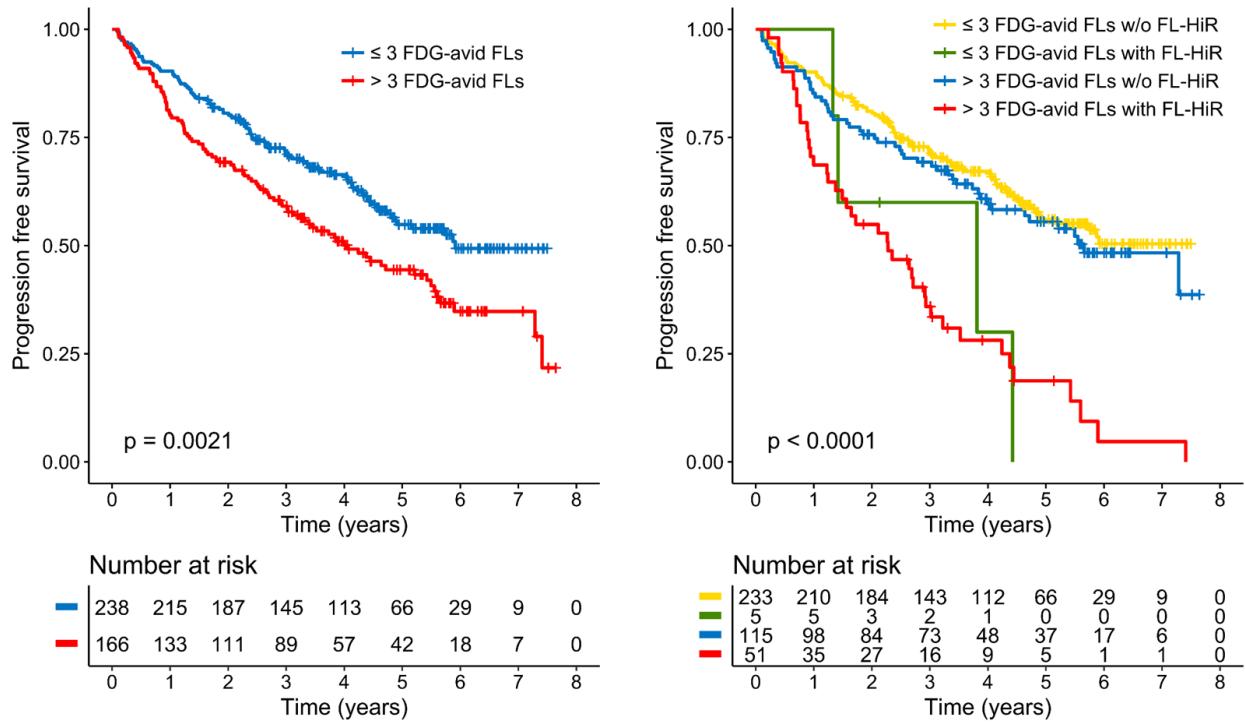

Supplementary Figure 1: Impact of the FL-HiR pattern on outcome for Total Therapy 4 - 6.
 Progression free survival for newly diagnosed MM patients enrolled into Total Therapies stratified by the presence of ≥ 3 large FLs. Statistical significance was determined using the log-rank test.

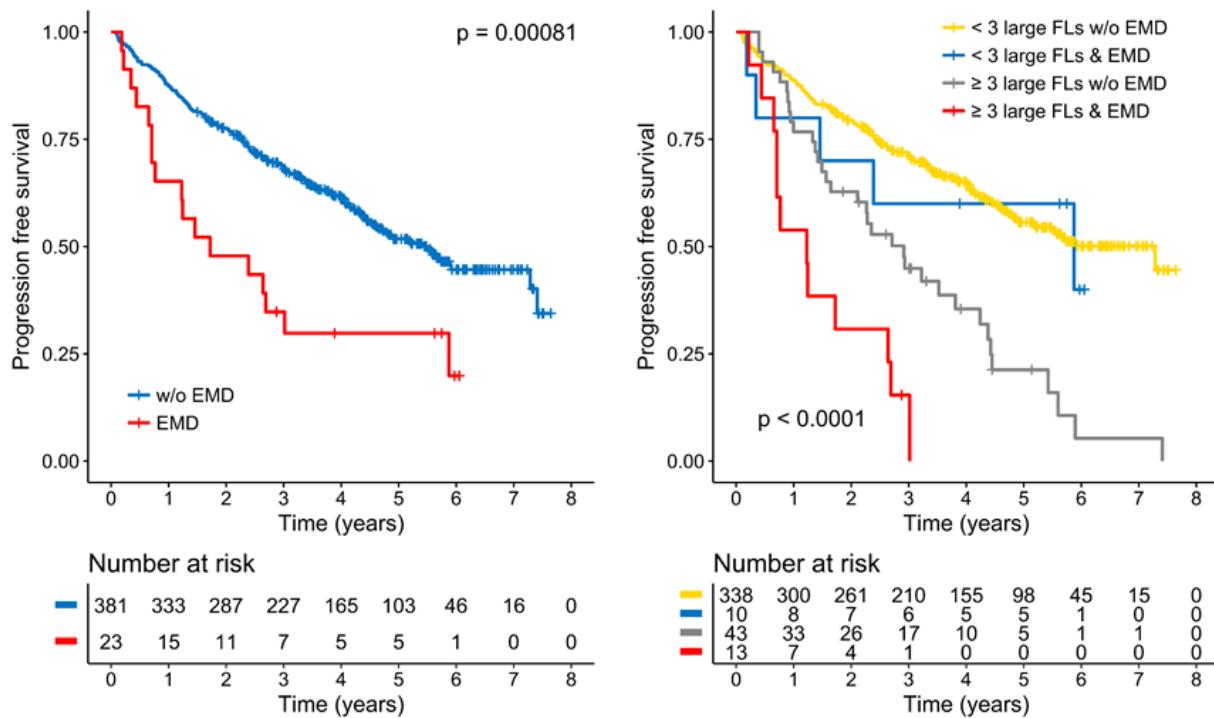

Supplementary Figure 2: Impact of focal lesion number stratified by the FL-HiR pattern. (Left panel) Progression free survival for patients with 1-2 large focal lesions vs. ≥ 3 large focal lesions. (Right panel) Progression free survival for patients with > 8 focal lesions stratified by the FL-HiR pattern. Statistical significance was determined using the log-rank test.

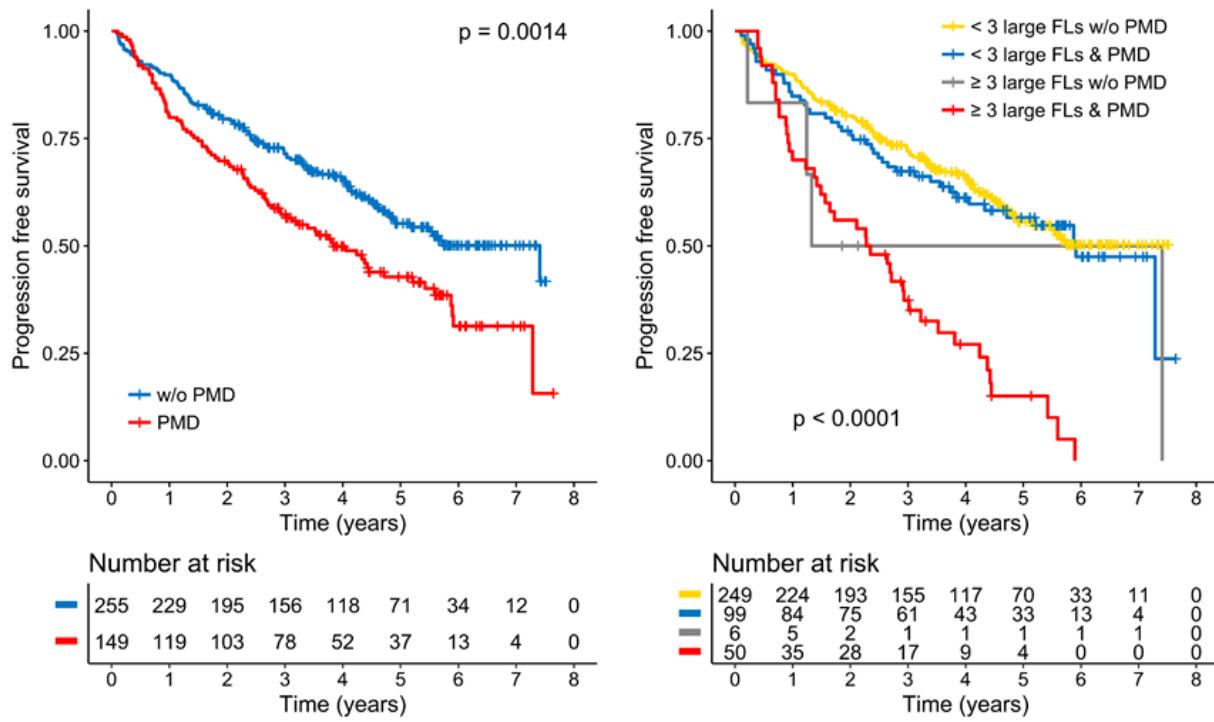

Supplementary Figure 3: Impact of focal lesion number on DWIBS on outcome. Progression free and overall survival for newly diagnosed MM patients enrolled into Total Therapies stratified by the number of focal lesions. Statistical significance was determined using the log-rank test.

Supplementary Figure 4: Impact of focal lesion number on PET-CT stratified by the FL-HiR pattern. (Left panel) Progression free survival for patients stratified by the number of FDG-avid focal lesions. (Right panel) Progression free survival for patients with > 3 focal lesions on PET-CT stratified by the FL-HiR pattern on DWIBS. Statistical significance was determined using the log-rank test.

Supplementary Figure 5: The impact of extramedullary disease on outcome. Progression free survival for patients presenting with extramedullary disease (EMD) in PET-CT at baseline (left panel). Progression free survival for patients with EMD in PET-CT stratified by the presence of ≥ 3 large FLs (*FL-HiR* pattern). The log-rank test was used to calculate p values.

Supplementary Figure 6: The impact of paramedullary disease on outcome. Progression free survival for patients presenting with paramedullary (PMD) components in PET-CT (left panel). Progression free survival for patients with PMD in PET-CT stratified by the presence of ≥ 3 large FLs. The log-rank test was used to calculate p values.
