Continuous variables are presented as mean with standard deviation (a) or median with interquartile range (b). FGR, fetal growth restriction; GA, gestational age; hsCRP, high sensitivity C-reactive protein; n.a., not applicable; sFlt, soluble fms-like tyrosine kinase. Comparisons between outcome groups (two-sided T-tests or Mann-Whitney U-test for comparisons of continuous variables between two groups, ANOVA and Tukey's test or Kruskal-Wallis and Dunn's test for comparisons of continuous variables between three groups, Chi-square test for categorical variables): \*P < 0.05 vs healthy pregnant.  $\ddagger GA$  at blood draw differs from GA at delivery only for healthy pregnant controls sampled during pregnancy (n = 18).  $\dagger P$ reeclampsia was subsevere if diagnosed with one or more severe features [1, 2].
