Additional File 1: Additional results on subgroup analyses

This figure shows the overall results for the inclusion criteria, extending Figure 5 for *auc* and *brier* and (in contrast to Figure 5) also displaying outlying values. We observe that results for different performance measures are close, with similar trends for the boxplots.

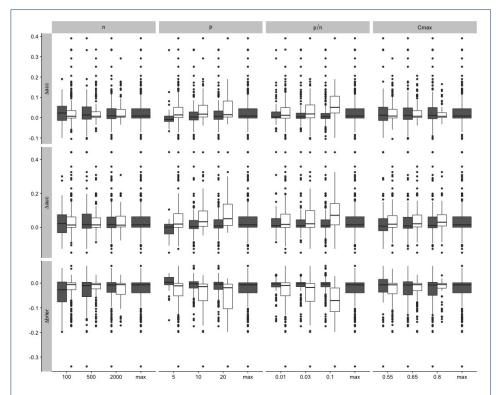

Figure 1 Extension of Figure 5 for all the considered measures. The three rows are respectively dedicated to the three measures acc, auc and brier. In each row, we plot four series of boxplots, representing different inclusion criteria for the meta-features n, p, $\frac{p}{n}$ and Cmax as in Figure 5. The dark boxplots represent the observations under the threshold, while the white boxplots represent the observations above the threshold. Note that outliers are shown here.
