**S7 Fig. Growth of *C. glutamicum* under combined exposure to *N*-myristoyltyrosine and streptomycin.** Liquid cultures (volume 800 µL) of *C. glutamicum* were supplemented with antibiotic compounds in a checkerboard matrix individually and in combinations in two-fold dilutions. Turbidities of cultures were measured at 650 nm after incubation for 20 h at 30 °C and constant agitation. Grey: Turbidities up to 0.06, defined as no growth. Different shades of blue: Strongly impaired growth with turbidities from 0.06 to 1.00, moderately impaired growth with turbidities from 1.00 to 4.10, and unimpaired growth with turbidities above 4.10. Values represent mean results from three independent measurements and the respective standard deviation.
