Surface areas of contacts between subunits were calculated using the PDBePISA server (<http://www.ebi.ac.uk/pdbe/pisa/>) and reported to 100 Å² accuracy. Local resolutions were estimated using the Local Resolution function in RELION with default parameters, then UCSF Chimera was used to extract the resolution at each atomic coordinate in each subunit and the values were averaged.

The phospholipids were assigned on two confidence levels, where 1 is the highest, based on the quality of the density and interactions with nearby residues. Cases in which partial overlap between phospholipids are observed in different structures are indicated with brackets. Interactions of phospholipids with subunits were determined with a 5 Å cut-off.
