

Habitat and landscape factors influence pollinators in a tropical megacity, Bangkok, Thailand

Supplemental Table S1. Descriptive information about the 52 green areas used in this study. Green areas were categorized as either public parks, schools, temples, or commercial areas. Patch size refers to land area only (the areas of large bodies of water were subtracted from the total area). The number of plots conducted per green area was approximately proportional to the size of the green area. Floral abundance refers to the average number of flowers per plot. Pollinator richness and abundance indicate the number of pollinator species and pollinator individuals, respectively, averaged across all plots within each green area.
