

Fig. S1 Permeabilisation of *A. thaliana* seedling with alamethicin from different sources

Seedlings were grown, pre-treated with cellulase, permeabilised, stained, and documented as described for Fig.1, except using H₂O in all steps instead of ½ MS and mannitol solution. Alamethicin from Sigma, A.G. Scientific (AGS) and Santa Cruz Biotechnology (SCB) were used. Bar corresponds to 5 mm. The images show one representative replicate out of two.
