Table S1. Model inputs.

Inputs	Source
Adult population by age/sex	2014 American Community Survey (ACS)
Adult pop. fraction by SNAP category	2014 Current Population Survey
Current food consumption	2003-2012 National Health and Nutrition Examination Survey (NHANES)
Mortality per 100k adults by disease	Adjusted mortality rates from 2000-2009 National Health Interview Survey (NHIS) linked with 2000-2011 National Vital Statistics System
Price effects on consumption	2017 systematic review and meta-analysis ¹⁵ and (for the SNAP-targeted interventions) randomized control trial ²²⁻²³
Price effect gradient with respect to inc.	2013 systematic review and meta-regression ³⁵
Relative risks for CMD from food intake	2017 systematic review and meta-analysis ^{30,36}

Table S2. Assumptions about own-price elasticity (percent change in intake per percent change in price) for food and beverage intake.

*Effects of national price changes were derived from a meta-analysis of longitudinal and interventional studies¹¹. The higher price-responsiveness among lower income groups was based on a 2013 meta-regression by Green et al.²³. The price-responsiveness for the SNAP targeted intervention was based on the Healthy Incentives Pilot in Hampden County, MA.^{11b}

*See Table 4 for corresponding unadjusted results. In Table 4, mortality rates differed across SNAP participation and eligibility categories, in part because of differences in the age distribution across the categories. The SNAP-eligible non-participant category was older on average (see Table S7) and had higher mortality rates per 100k adults (see Table 4). The adjusted results in this table assume constant baseline age and sex distribution across SNAP categories.
