Table S2 | Fluorescence lifetime and anisotropy of Cy3 and Cy5, Related to Figure 2.

Virions were produced as described in **STAR Methods**, and labeled with either the Cy3 or Cy5 fluorophore. Measurements were made on a QuantaMaster 400 fluorimeter equipped with a time-correlated single photon counting module (PTI).

Table S3 | Rates of transition between the observed FRET states, Related to Figure 7.

Rate constants were determined by fitting of dwell time histograms to an exponential function (**STAR Methods**). Given the time resolution of imaging of 25 frames/s, according to the Shannon-Nyquist sampling theorem rates greater than 12.5 s $^{-1}$ may not have been determined with high accuracy. Errors represent 95% confidence intervals determined during fitting. Rates are defined as in **Figure 7**.
