*Estimates derived from models with terms for the interaction between cardiorespiratory fitness (in quartile and continuous forms) and age, sex, or obesity status, while adjusting for age, sex, field center, national background, birth in US mainland, annual household income, and parent education level; P-values derived from models using the continuous cardiorespiratory fitness variable; presented p-values were derived from models in which cardiorespiratory fitness was treated as a continuous variable.

†Lowest quartile (Q1) is reference category; ‡Each 10 ml/kg/min increment; Boldface signifies statistically significant interaction between cardiorespiratory fitness and sex.

BMI, body mass index; CRP, C-reactive protein; DBP, diastolic blood pressure; FPG, fasting plasma glucose; HDL, high density lipoprotein; HOMA-IR, homeostasis model assessment – insulin resistance; PAI-1, plasminogen activator inhibitor-1; SBP, systolic blood pressure.

*Estimates derived from models with terms for the interaction between cardiorespiratory fitness (in quartile and continuous forms) and age, sex, or obesity status, while adjusting for age, sex, field center, national background, birth in US mainland, annual household income, and parent education level; P-values derived from models using the continuous cardiorespiratory fitness variable; presented p-values were derived from models in which cardiorespiratory fitness was treated as a continuous variable.

†Lowest quartile (Q1) is reference category; ‡Each 10 ml/kg/min increment; Boldface signifies statistically significant interaction between cardiorespiratory fitness and age.

BMI, body mass index; CRP, C-reactive protein; DBP, diastolic blood pressure; FPG, fasting plasma glucose; HDL, high density lipoprotein; HOMA-IR, homeostasis model assessment – insulin

resistance; PAI-1, plasminogen activator inhibitor-1; SBP, systolic blood pressure.
