

Supplementary Figure 1: Pure-tone audiometry audiograms for family members III:1 (top; age 43) and IV:3 (bottom; age 17). x represents the air conduction results for the left ear and o for the right ear. Bone conduction measurements were overlapping. III:1 shows a mild-to-moderate impairment on the left ear, which is increased in threshold compared to presbycusis, according to the ISO 7029 standard (95th percentile) for the same age and gender.
