

Multiple Domains of Bacterial and Human Lon Proteases Define Substrate Selectivity

Lihong He¹, Dongyang Luo², Fan Yang³, Chunhao Li⁴, Xuegong Zhang², Haiteng Deng³, and Jing-Ren Zhang^{1,5*}

List of the supplementary figures and tables

Figure S1. Detection of protein stability in the presence of the proteolytically inactive Lon.

Figure S2. *In vitro* degradation of common substrates by the bacterial and human Lon variants.

Figure S3. Amino acid frequency at the cleavage sites within Lon common substrates.

Figure S4. Construction and *in vivo* degradation of the HU β variants.

Figure S5. Schematic illustration for construction of the Lon proteases and their variants.

Figure S6. The amount of protein in the presence of the domain swap mutants between eLon and hLon.

Figure S7. Examples for amino acids surrounding Lon cleavage site and data input format in Seq2logo.

Figure S8. CD spectra of heat-treated and untreated HU β and BSA.

Table S1. Bacterial strains and plasmids used in this study.

Table S2. Primers used in this study.

Table S3. The materials and conditions for production of recombinant target proteins.

Table S4. The biochemical characteristics of *Francisella* Lon substrates.

Table S5. Lon substrates α -casein-, RpsB-, SulA-, and HU β -derived peptides identified in MS. (as individual files)

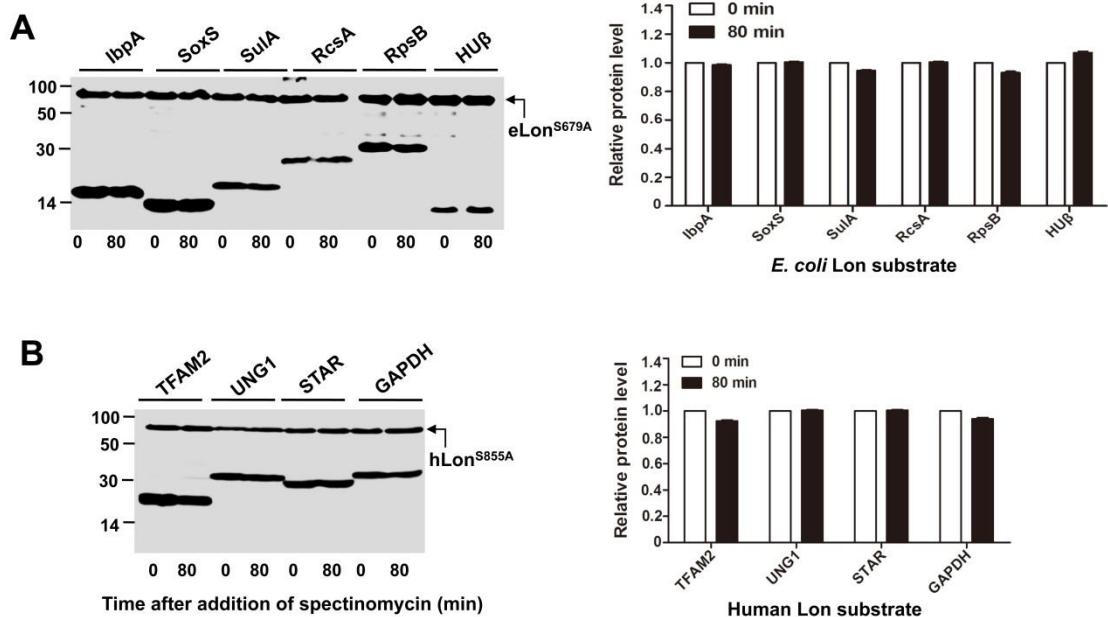

Figure S1. Detection of protein stability in the presence of the proteolytically inactive Lon. (A) Stability of the *E. coli* Lon substrates was detected in the presence of eLon^{S679A}. (B) Stability of the human Lon substrates was detected in the presence of hLon^{S855A}. Protein detection and quantification were carried out as in Fig. 1.

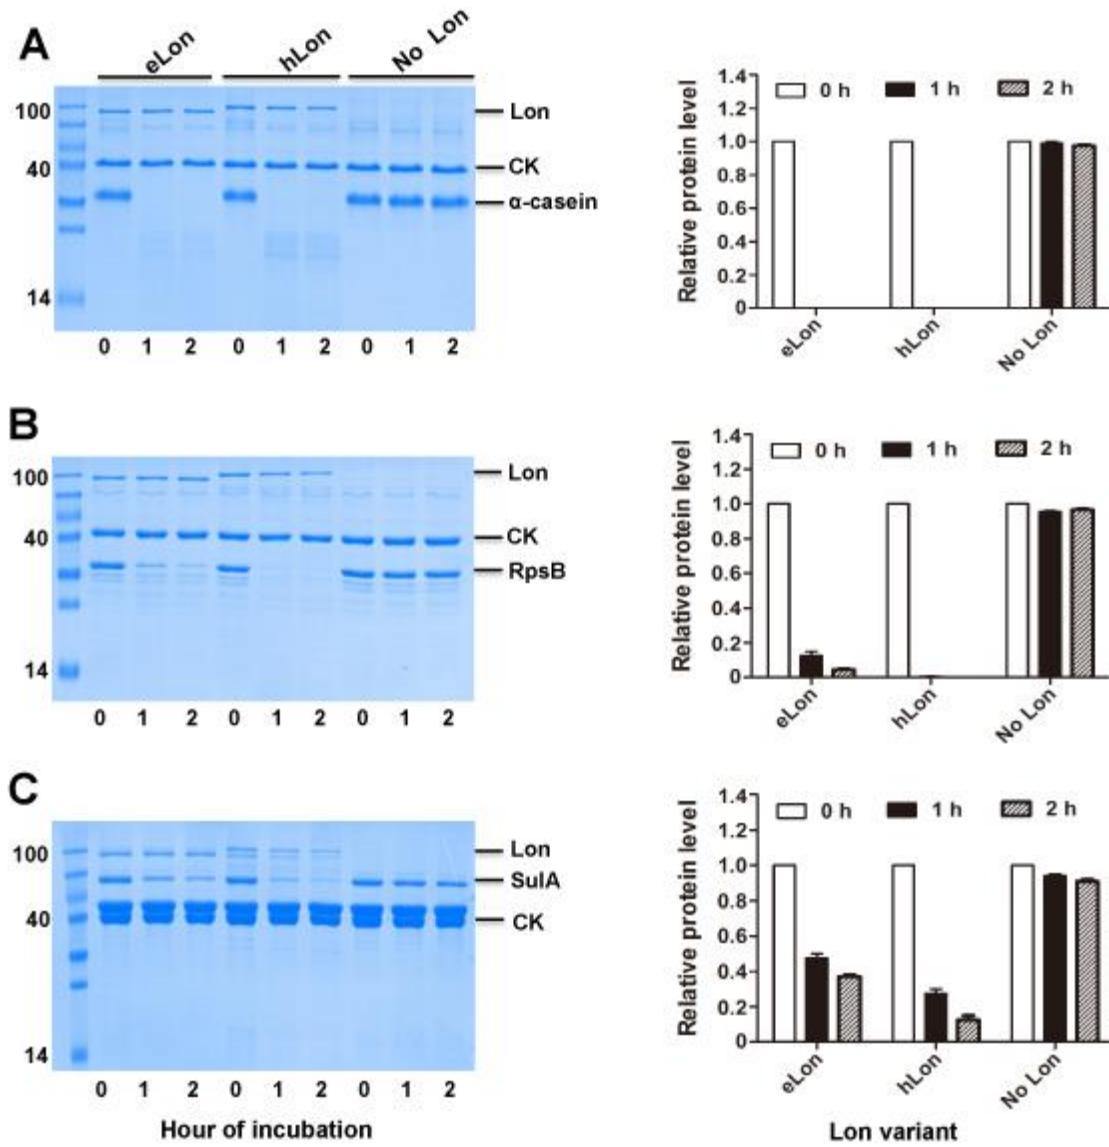

Figure S2. *In vitro* degradation of common substrates by the bacterial and human Lon variants. α -casein (A) and recombinant RpsB (B) and SulA (C) (15 μ g) was incubated at 37 °C with the Lon protease (10 μ g) of *E. coli* (eLon) or human (hLon). The proteins in the reactions were detected by SDS-PAGE and Coomassie Brilliant staining at 0, 1 and 2 h as in Fig. 7. Protein was quantified by Image Lab and presented as relative value to the sample taken at 0 hour as in Fig. 7 (left panel of A, B and C).

SuIA

Figure S3. Amino acid frequency at the cleavage sites within Lon common substrates. A Python script was used to calculate the amino acids surrounding the cleavage site. The total number of amino acid residues at the P (-5) to P (-1) and P (+1) to P (+5) positions within α -casein, RpsB, and SulA are shown in tabular form. Percentage refers to ratio of total number of amino acid residues at P (-1) position to that in α -casein, RpsB, and SulA protein sequence, respectively (shown as total residues). Total refers to the total number of amino acid residues in each position.

A

Tag fused to HU β	Sequence	Primer set		Plasmid
		HU β	Tag peptide	
sul20 (SulA ¹⁵⁰⁻¹⁶⁹)	ASSHATRQLSGLKIHSNLYH	Pr11813/Pr13599	Pr13600/Pr13601	pST11415

RpsB40 (RpsB ¹⁴³⁻¹⁸²)	KLENSLGGIKDMGGLPDALF V IDADHEHIAKEANNLGP	Pr11813/Pr13733	Pr13734/Pr13623	pST11488

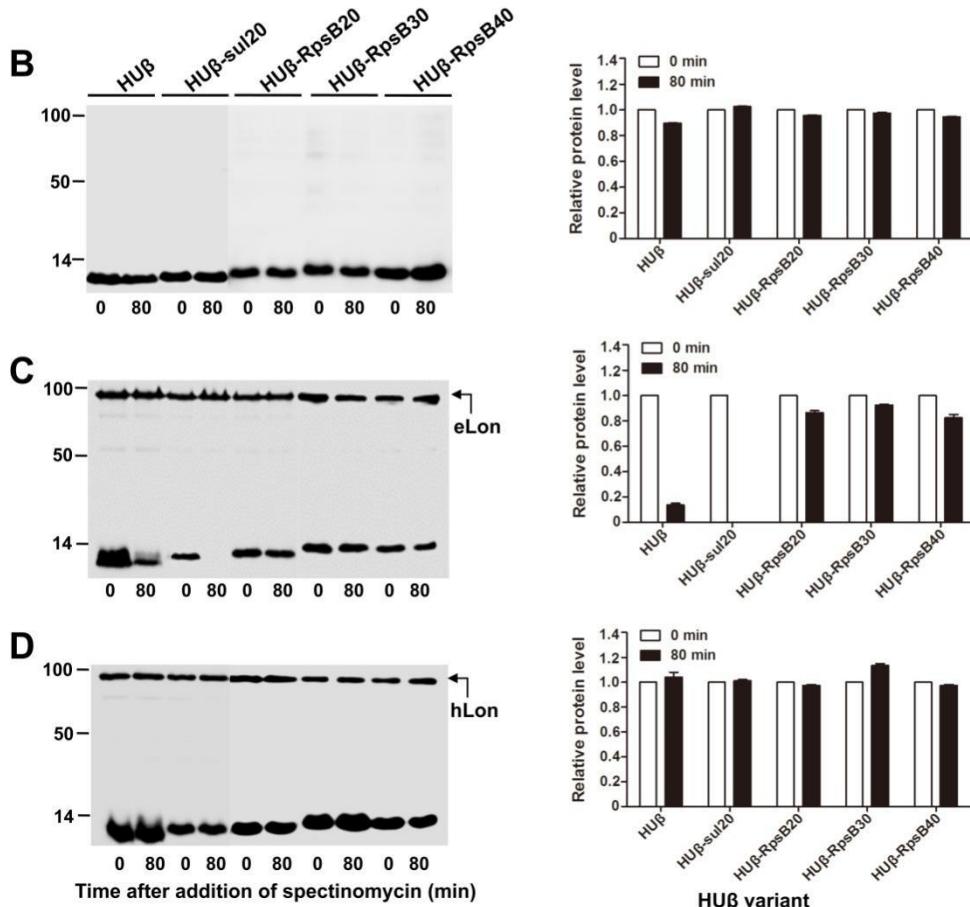

Figure S4. Construction and *in vivo* degradation of the HU β variants. The tag sequences, primers and resulting plasmids were listed in (A). The bold-face letter shows amino acid Val¹⁶³ which was the most abundantly cleaved site in the hLon-treated RpsB. Stability of the HU β variants was detected in the absence (B) or presence of eLon (C) or hLon (D) as in Fig 3.

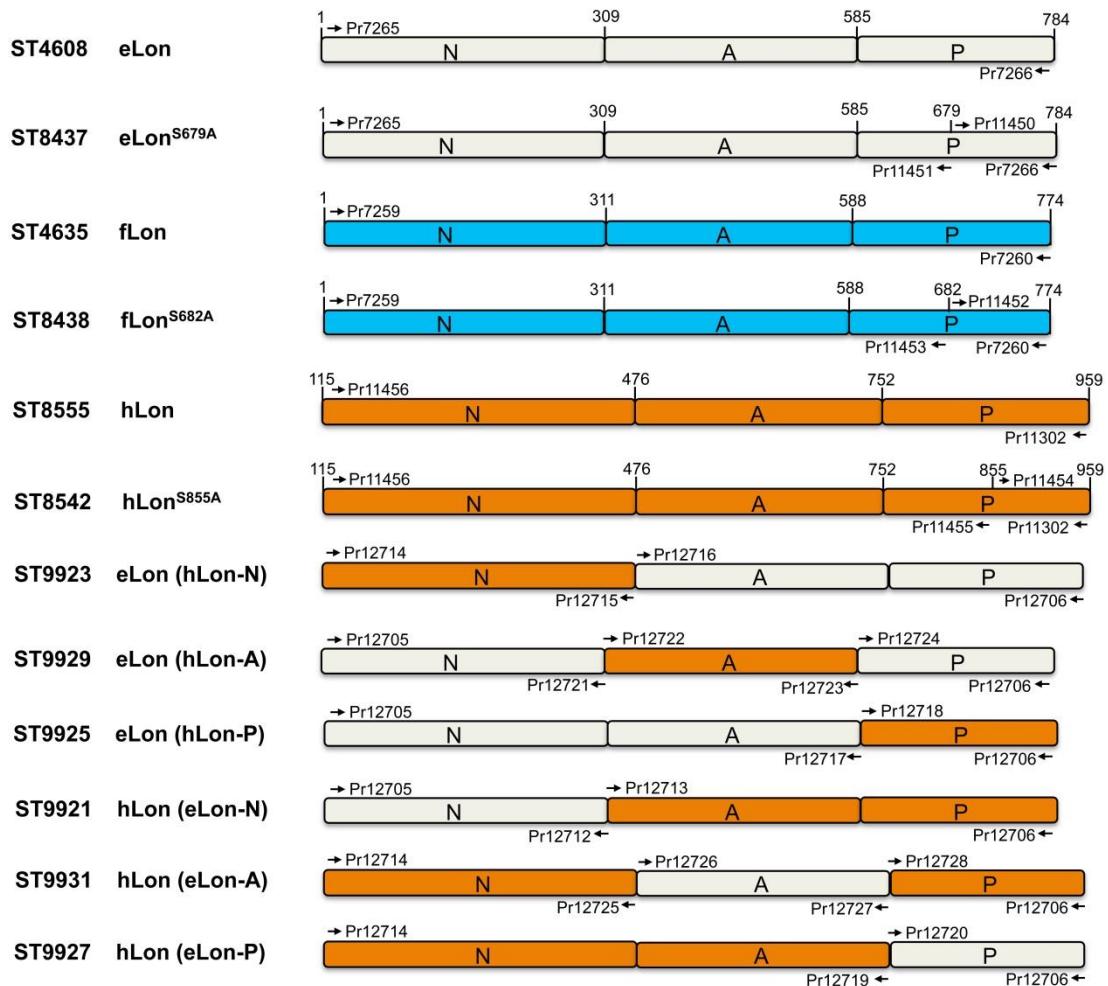

Figure S5. Schematic illustration for construction of the Lon proteases and their variants. Bacterial and human Lon consist of three domains: an N-terminal domain (N domain), a central ATPase domain (A domain) and a C-terminal proteolytic domain (P domain). These domains in eLon, fLon, or hLon are drawn in gray, blue, or orange, respectively. The range of each domain is indicated above the diagram. The hLon was constructed in truncated form lacking amino acids 1-114 of the predicted mitochondrial targeting sequence (MTS). The primer set used for construction of Lon proteases and their variants and the resulting plasmids are listed. The Lon domain swap mutants are designated following the principle, for example, eLon (hLon-N) represent that the N domain of eLon was replaced by the equivalent domain of hLon.

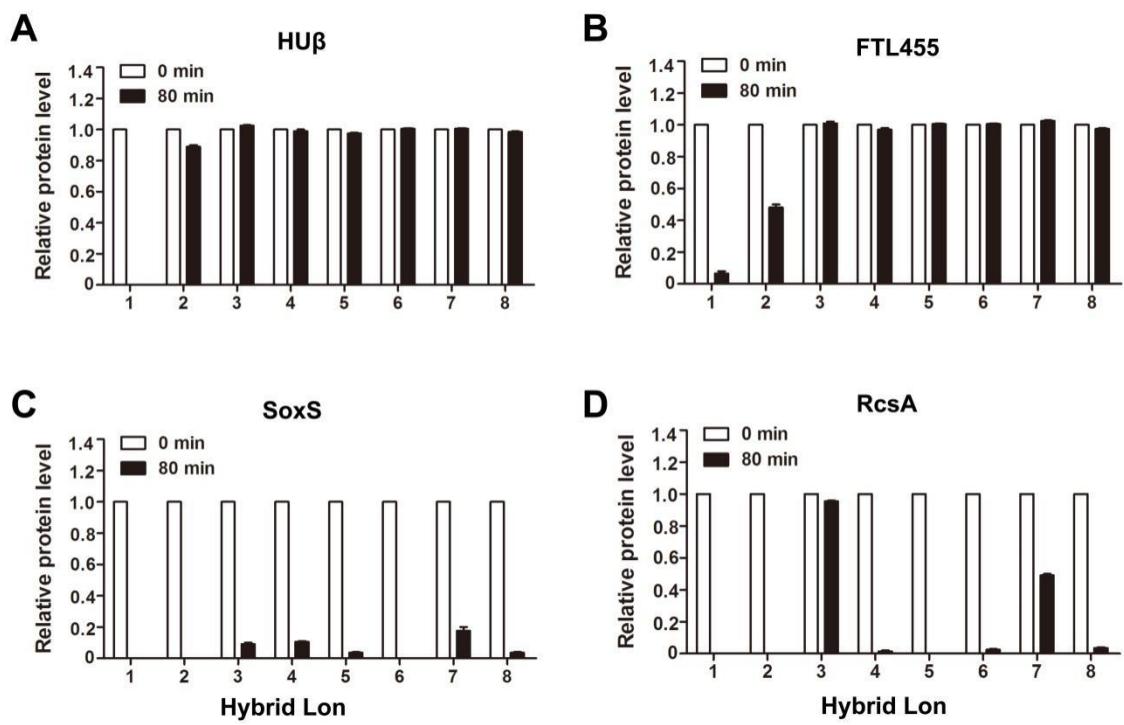

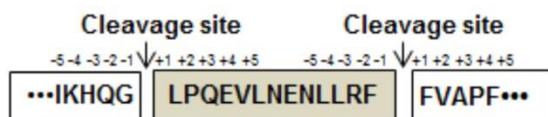

Figure S6. The amount of protein in the presence of the domain swap mutants between eLon and hLon. Bands from the Fig. 8 were quantified. The amount of HU β (A), FTL455 (B), SoxS (C), and RcsA (D) were detected as in Fig. 1.

Figure S7. Examples for amino acids surrounding Lon cleavage site and data input format in *Seq2logo*. One peptide from α -casein was listed and the amino acids surrounding cleavage site were labeled in (A). The frequency format of eLon-treated α -casein was presented in (B). It is characterized by having a header line containing all the amino acids, and a header column containing the given positions. The numbers in 20 columns represent the amino acid frequency in each position.

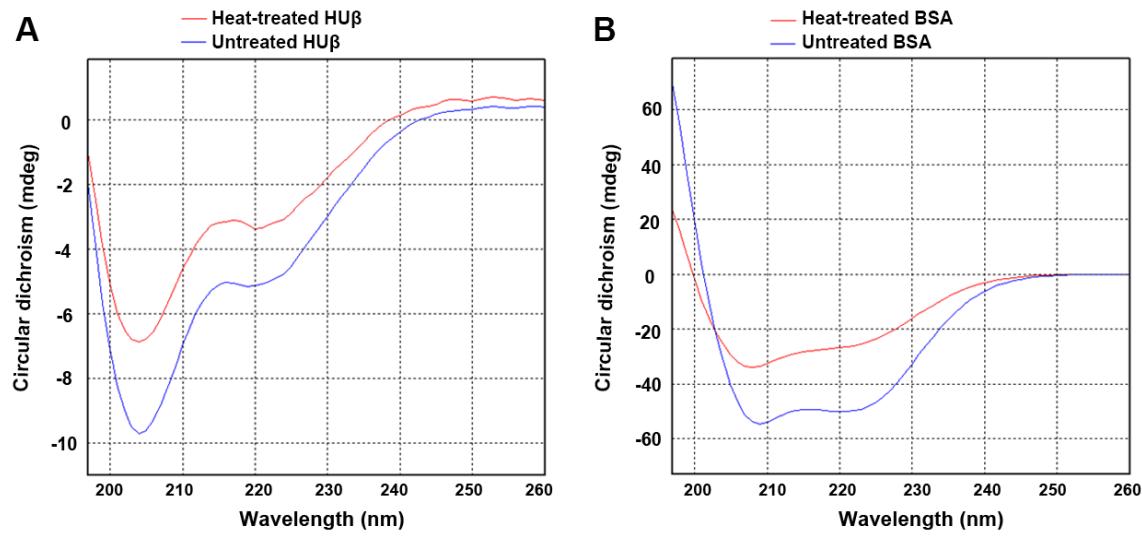

Figure S8. CD spectra of heat-treated and untreated HU β and BSA. Spectra of heat-treated and untreated BSA and purified HU β (0.2 mg/ml) in Tris buffer (2 mM Tris, 2 mM NaCl, pH 8.0) were recorded in a Chirascan™-plus CD Spectrometer. The red and blue lines represent the spectrum of heat-treated and untreated HU β (A) and BSA (B), respectively.

Table S3. The materials and conditions for production of the recombinant proteins

Gene ID ¹	Description	Abundance Ratio ²	Primer set ³ , plasmid ⁴	Degradation ⁵	Induction condition ⁶
FTL528	Type III restriction enzyme	3.037	Pr10884/Pr10931, pST7529	No	37 °C 220 rpm 0.5 h
FTL1136	Hypothetical protein	2.691	Pr10900/Pr10933, pST7537	No	37 °C 220 rpm 2 h
FTL499	S-adenosylmethionine decarboxylase	2.347	Pr10882/Pr10883, pST7528	No	37 °C 220 rpm 0.5 h
FTL127	Formate dehydrogenase	2.243	Pr7757/Pr7758, pST5005	No	37 °C 220 rpm 2 h
FTL1218	PAS fold family protein	2.217	Pr7753/Pr7754, pST5010; Pr11207/Pr11208, pST7984	Yes	37 °C 220 rpm 1 h
FTL1917	30S ribosomal protein S6	2.060	Pr10912/Pr10913, pST7543	No	37 °C 220 rpm 2 h
FTL316	Arsenate reductase	1.966	Pr10878/Pr10930, pST7526; Pr11191/Pr11192, pST7976	Yes	37 °C 220 rpm 0.5 h
FTL1923	Zinc carboxypeptidase family protein	1.900	Pr10914/Pr10915, pST7544	No	37 °C 220 rpm 0.5 h
FTL196	UDP-3-O-[3-hydroxymyristoyl] glucosamine N-acyltransferase	1.856	Pr10876/Pr10877, pST7525; Pr11189/Pr11190, pST7975	Yes	37 °C 220 rpm 0.5 h
FTL1244	Exodeoxyribonuclease III	1.842	Pr10928/Pr10929, pST7540	No	No expression
FTL160	LamB/YcsF family protein	1.789	Pr10874/Pr10875, pST7524	No	Inclusion body
FTL1566	CutC family protein	1.753	Pr10908/Pr10909, pST7541; Pr11213/Pr11214, pST7987	No	37 °C 220 rpm 0.5 h
FTL975	Nif3 family protein	1.661	Pr10892/Pr10893, pST7533	No	37 °C 220 rpm 2 h
FTL1003	DNA polymerase III subunit epsilon	1.652	Pr10896/Pr10897, pST7535; Pr11197/Pr11198, pST7979	Yes	37 °C 220 rpm 0.5 h
FTL1935	ABC transporter ATP-binding protein	1.632	Pr10916/Pr10917, pST7545; Pr11205/Pr11206, pST7983	Yes	16 °C 180 rpm 3 h
FTL965	ATP-dependent protease peptidase subunit	1.616	Pr10890/Pr10891, pST7532; Pr11209/Pr11210, pST7985	No	16 °C 180 rpm 3 h
FTL1644	Glycerol kinase	1.607	Pr10910/Pr10911, pST7542	No	37 °C 220 rpm 0.5 h
FTL995	Haloacid dehalogenase	1.591	Pr10894/Pr10895, pST7534; Pr11211/Pr11212, pST7986	No	37 °C 220 rpm 0.5 h
FTL455	Acetyltransferase	1.581	Pr10880/Pr10881, pST7527; Pr11193/Pr11194, pST7977	Yes	37 °C 220 rpm 0.5 h
FTL1034	Sulfate	1.570	Pr10898/Pr10932, pST7536;	Yes	16 °C 180

	adenylyltransferase		Pr11199/Pr11200, pST7980		rpm 3 h
FTL714	D-3-phosphoglycerate dehydrogenase	1.559	Pr10886/Pr10887, pST7530	No	Inclusion body
FTL1216	Hypothetical protein	1.531	Pr10904/Pr10905, pST7539; Pr11203/Pr11204, pST7982	Yes	37 °C 220 rpm 0.5 h
FTL1167	Hypothetical protein	1.499	Pr10902/Pr10903, pST7538; Pr11201/Pr11202, pST7981	Yes	37 °C 220 rpm 1 h
FTL964	ATP-dependent protease ATP-binding subunit HsIU	1.493	Pr10888/Pr10889, pST7531; Pr11195/Pr11196, pST7978	Yes	37 °C 220 rpm 1 h
b169, <i>rpsB</i>	30S ribosomal subunit protein S2		Pr11811/Pr11812, pST8968	No	37 °C 220 rpm 0.5 h
b440, <i>hupB</i>	DNA-binding protein HUβ		Pr11813/Pr11814, pST8969	Yes	37 °C 220 rpm 0.5 h
b958, <i>sula</i>	SOS cell division inhibitor		Pr11219/Pr11220, pST7990	Yes	37 °C 220 rpm 0.5 h
b1951, <i>rcsA</i>	Positive regulator of capsule biosynthesis		Pr11221/Pr11222, pST7991	Yes	37 °C 220 rpm 0.5 h
b3687, <i>ibpA</i>	Heat shock chaperone		Pr11215/Pr11216, pST7988	No	37 °C 220 rpm 0.5 h
b4062, <i>soxS</i>	Regulator of superoxide response regulon		Pr11217/Pr11218, pST7989	Yes	37 °C 220 rpm 0.5 h
TFAM2, MG824985	Transcription factor A, mitochondrial isoform 2		Pr12088/Pr12089, pST9320	Yes	37 °C 220 rpm 0.5 h
UNG1, MG824986	Uracil-DNA glycosylase isoform 1		Pr12090/Pr12091, pST9321	Yes	37 °C 220 rpm 0.5 h
STAR, MG824987	Steroidogenic acute regulatory protein, mitochondrial		Pr12092/Pr12093, pST9322	Yes	37 °C 220 rpm 0.5 h
GAPDH, NM_0012897 45.1	Glyceraldehyde-3-phosphate dehydrogenase		Pr11626/Pr11627, pST8721	Yes	37 °C 220 rpm 0.5 h

¹*Francisella* and *E. coli* genes are available under the GenBank accessions NC_007880 (LVS genome) and NC_000913 (MG1655 genome).

²Quantitative abundance ratio of the protein in the Δlon mutant vs. LVS.

³Primer set used to amplify the target genes.

⁴pACYCDuet and pEDL17 derivatives containing the target genes.

⁵Degradable or undegradable by fLon in *E. coli*.

⁶Induction condition for each target gene.

Table S4. The biochemical characteristics of *Francisella* Lon substrates

Gene	Description	Length ¹	Nonpolar AAs composition ²	Aromatic AAs composition ³	Cellular localization ⁴
FTL196, <i>lpxD</i>	UDP-3-O-[3-hydroxymyristoyl] glucosamine N-acyltransferase	347	41.6	5.9	Cytoplasm
FTL316	Arsenate reductase	117	37.7	12.9	Cytoplasm
FTL455	Acetyltransferase	171	34.6	18.7	Cytoplasm
FTL578, <i>ocd</i>	Ornithine cyclodeaminase	282	42.5	7.0	Cytoplasm
FTL663	Heat shock protein	122	34.3	7.3	Cytoplasm
FTL964, <i>hslU</i>	ATP-dependent protease ATP-binding subunit HslU	455	42.2	3.9	Cytoplasm
FTL1003, <i>dnaQ</i>	DNA polymerase III subunit epsilon	238	42	9.3	Cytoplasm
FTL1034, <i>cysN</i>	Sulfate adenylyltransferase	317	38.8	7.6	Cytoplasm
FTL1167	Hypothetical protein	173	45.2	5.3	Cytoplasm
FTL1216	Hypothetical protein	194	40.7	8.7	Cytoplasm
FTL1217	Heat shock protein	123	35.8	7.6	Cytoplasm
FTL1218	PAS fold family protein	329	39.8	10.4	Cytoplasm
FTL1228, <i>sufD</i>	SufS activator complex, SufD subunit	381	41.1	9.1	Cytoplasm
FTL1935	ABC transporter ATP-binding protein	225	40.9	8.9	Cytoplasm
FTL1957	Heat shock protein	142	31.6	9.1	Cytoplasm

¹The total amino acids number of each protein.

²Percentage of the nonpolar amino acids (Ala, Val, Leu, Ile, Pro, Phe, Trp, and Met) in each protein.

³Percentage of the aromatic amino acids (Tyr, Phe, and Trp) in each protein.

⁴Subcellular localization of each protein is predicted based on signal peptide prediction with web-based SignalP 4.1 (<http://www.cbs.dtu.dk/services/SignalP/>) and transmembrane helices prediction with TMHMM 2.0 (<http://www.cbs.dtu.dk/services/TMHMM/>).
