

Table S1. List of 181 datasets from 74 studies included in this meta-analysis. Irrig = irrigation; N = sample size; climate type according to Köppen–Geiger's classification (Kottek, Grieser, Beck, Rudolf, & Rubel, 2006; med = Mediterranean, oceanic, cont-step = continental and steppe climates); study design: block/1 vin = single vineyard with randomized block design, block/sev vin = several vineyards with replicated block or vin = vineyards as replicates; control type: BS = bare soil, CO = conventional management, OT = other type of vegetation management; Veg = vegetation management: TI = tillage, HE = herbicides, OT = other type of vegetation management including combined tillage and herbicide application in inter-rows; NA – missing information; the algebraic sign of log response ratio ($\ln R$) was changed if larger effect sizes caused an overall negative effect on ES provision, e.g. higher soil loss decreases ES provision ($\ln R^*$); grey background: we combined effect sizes from different years, localities, taxonomic subgroups within an order or soil layers for that dataset. The source Daane & Costello 1998 includes different study sites, therefore vegetation management differs within the extracted datasets of that study.
