## **SUPPORTING INFORMATION CAPTIONS**

**S1 Fig. Schematic representation of the HERVnGoSeq computational pipeline.**

**S2 Fig. Causal diagram of the hypothesized relationship between tagging SNPs, HERV-K insertion polymorphisms, and human disease phenotypes.**

SNPs associated with disease phenotypes via genome-wide association studies are tagging (i.e. in strong LD with) the true causal variant, a polymorphic HERV-K insertion.

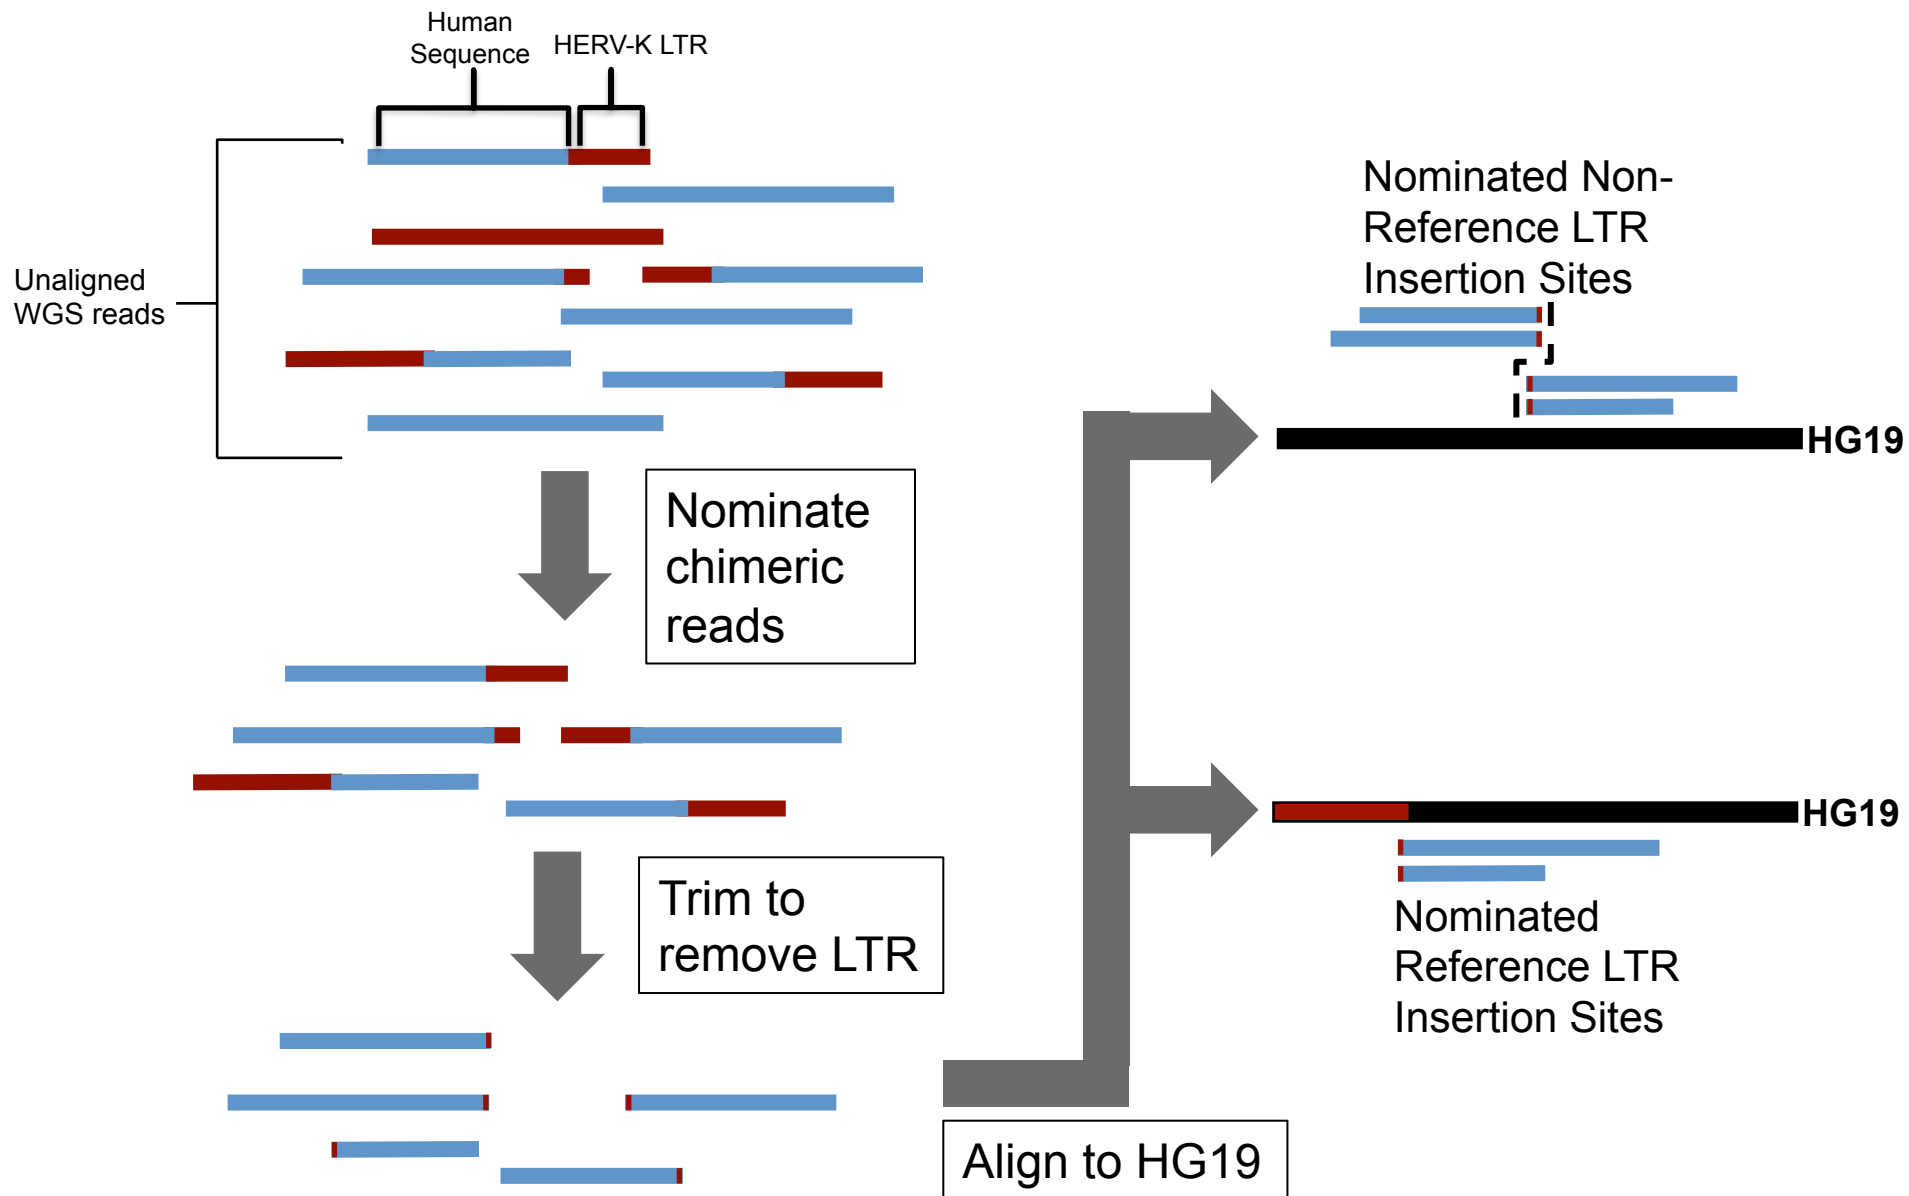

**S3-S50 Fig. Manhattan plots for each of the 48 HERV-K insertion sites that are 'taggable' by SNPs.** Logistic regression p-values stratified by 5 super populations. AFR African, AMR Native American, EUR European, EAS East Asian, SAS South Asian.

**S51-S63 Fig. Venn diagrams.** Diagrams show the overlap between hiSNP sets derived by logistic regression of HERVnGoSeq presence/absence calls, logistic regression of dichotomized genotypes called by the 1000 Genomes Structural Variant Group, and the  $r^2$  measure of linkage disequilibrium

**S64 Fig. Hierarchical chart of experimental factor ontology enrichment terms.** Hue intensity is inversely proportional to the magnitude of the p-value for significance.

**S65 Fig. Estimated prevalence of 23 non-reference HERV-K insertion sites detected in the 1000 Genomes population by both HERVnGoSeq (red) and a previous publication (blue).**
