

Figure S1. J774 cells were incubated ± 5 $\mu\text{g/ml}$ mouse SAA in the presence or absence of 10 μM P2X7R-specific antagonist AZ10606120 for 24 h and activation of caspase-1 was determined by immunoblot analysis. The migration of procaspase-1 (p49) and the active caspase-1 (p20) cleavage product is indicated.
