

**Figure S2. Fermentation profiles of XR-XDH-inserted and XI-inserted strains with *pho13delta* on xylose containing medium.**

Cells were initially inoculated at  $OD_{600}=5$  and cultivated in 60 g/L xylose for 72 hours at 36 ° C. **a, b:** concentration of D-xylose; **c, d:** concentration of ethanol; **a, c:** *S. cerevisiae* expressing XR-XDH; **b, d:** *S. cerevisiae* expressing XI. Blue line: control strains (YK001 or SS82); Red line: strains with *PHO13* deletion (YK002 or YK149); Green line: strains overexpressing all PPP genes with *PHO13* deletion (YK115 or YK150). Each data point is an average of triplicate cultures.
