

Supplementary Fig. 2

The boxplots show MFI levels of significantly altered markers, PD1 and BTLA, on different B-cell subsets from individuals with no history of medication use, compared with individuals using Metformin, NSAIDs or Statins as described in legend to Figure 3. The B-cell subsets were identified using flow cytometry. Pair-wise differences between the cohorts in each panel were performed using the Mann-Whitney U Test. Significant differences are indicated by stars: * p-values ≤ 0.05, ** p-values ≤ 5x10⁻³, *** p-value ≤ 5x10⁻⁴.
